Abstract

Signcryption is a cryptography primitive that fulfills both the functions of digital signature and encryption and guarantees non-repudiation, confidentiality and integrity in a more efficient way. In this paper, we propose an efficient and secure identity based multi-proxy multi signcryption scheme from bilinear pairings. In this scheme a group of proxy signcrupters could authorize by a group of original signcrupters. Then multi proxy multi signcryption could generate by the cooperation of all signcrupters in the proxy group.
