ABSTRACT
Real world engineering problems are usually designed by the presence of many conflicting objectives. In this paper, an approach is developed to solve multi-objective structural design using parameterized t-norms and t-co-norms based intuitionistic fuzzy optimization technique. Here binary t-norms, t-conorms are extended in the form of n-ary t-norms and t-co-norms and their basic properties are discussed with some special cases. In this paper we have considered a multi objective structural optimization model with weight and deflection as objectives and stress as constraint function. Here design variables are considered as cross sectional area of bars. This classical truss optimization example is presented here to demonstrate the efficiency of our proposed optimization approach. Numerical example is given here to illustrate this structural model through this approximation method.

Keywords
Intuitionistic Fuzzy Set, T-norms, T-co-norms, Structural Optimization.

1. INTRODUCTION
Structural design optimization is a challenging research topic nowadays. The challenge is to design structure with light weight and with minimum cost. It has been seen that multi objectives conflict with each other, and optimizing the problem considering a single objective can result an unacceptable results with respect to the other objectives. A reasonable solution to a multi-objective problem is a set of solutions, each of which satisfies the objectives without being dominated by any other solution. There are two general approaches for multiple-objective optimization problem. One of this is , make individual objective functions by combining all objective functions into a single composite function or move all objective but one to the constraint set. In the former case, determination of a single objective can be made by utility theory or weighted sum method, where weights or utility functions are dependent on the decision-maker’s preferences. Sometimes, it can be very difficult to accurately select these weights. In the latter case, as a constraining value must be established for each of these former objectives there is a problem to move objectives to the constraint set. Again this can be arbitrary. So in both cases, a set of solutions in exchange of single solution would return by optimization method for examination of trade-offs. For this reason, decision-makers often choose a set of good solutions considering the multiple objectives. The second general approach is finding an entire Pareto optimal solution set. A Pareto optimal set is nothing but a set of solutions that are non dominated with respect to each other. A Pareto optimal set of solution is one, when we go from any Pareto optimal solution to another Pareto optimal solution, there always at least one objective function improves with sacrifice of at least one other. Since the final solution of the decision-maker is always a trade-off when considering real-life problems Pareto optimal solution sets are often preferred.

It has been seen that numerous engineering design problem need to deal with imprecise data, manufacturing error or uncertainty of the environment during the design process. fuzzy as well as intuitionistic fuzzy optimization in case of structural engineering not only helps the engineers in their design and analysis of systems but also leads to significant advances and new discoveries in fuzzy optimization theory and technique. This fuzzy set theory was first introduced by Zadeh [4]. As an extension Intuitionistic fuzzy set theory was first introduced by Atanassov [3].When an imprecise information cannot be expressed by means of conventional fuzzy set, Intuitionistic Fuzzy set play an important role. In intuitionistic fuzzy ($IF$) set we usually consider degree of acceptance, degree of non membership and hesitancy function whereas we consider only membership function in fuzzy set. A few research works has been done on intuitionistic fuzzy optimization in the field of structural optimization. Dey et al.[2] used intuitionistic fuzzy technique to optimize single objective two bar truss structural model. Dey et al.[9] used multi-objective intuitionistic optimization technique in their paper on three bar truss structural model. This is the first time a parameterized intuitionistic multi-objective nonlinear programming is introduced in this paper with an application in structural design.

An important concept in fuzzy as well as intuitionistic fuzzy set theory are triangular norms and conform which are nothing but a generalized intersection and union of fuzzy sets. Alsina et al.[6] introduced the t-norm in fuzzy set theory and suggested that the t-norms could be used for the intersection of fuzzy sets. G.Deschrijver et al.[7] introduced the concept of intuitionistic fuzzy t-norm and t-co-norm to investigate the theorems for similar representation of aggregated t-norm and t-conorm.

As per our best of knowledge, this is the first time parameterized t-norms and t-co-norm based intuitionistic fuzzy optimization programming technique is being used to solve multi-objective structural model in this paper. In the test problem we have considered three-bar planar truss subjected to a single load condition where the objective functions are weight of the truss and deflection of loaded joint and the design variables are the cross-sections of bars with the constraints as stresses in members.

The remainder of this paper is organized in the following way. In section 2 structural optimization model is discussed. In section 3, mathematics Prerequisites is discussed with extended n-ary t-norms and t-co-norms and calculation of
some of special cases. In section 4, we discuss about weighted fuzzy aggregation. In section 5, we proposed the technique to solve a multi-objective non-linear programming problem using extended parameterized t-norms and t-co-norm based intuitionistic fuzzy optimization. In section 6, multi-objective structural model is solved using extended parameterized t-norms and t-co-norm based intuitionistic fuzzy optimization. Numerical illustration of structural model of three bar truss and comparison of results by using different extended weighted t-norms and t-co-norm are discussed in section 7. Finally, we draw conclusions in section 8.

2. MULTI-OBJECTIVE STRUCTURAL MODEL
In the design problem of the structure i.e. lightest weight of the structure and minimum deflection of the loaded joint that satisfies all stress constraints in members of the structure. In truss structure system, the basic parameters (including allowable stress, etc) are known and the optimization’s target is that identify the optimal bar truss cross-section area so that the structure is of the smallest total weight with minimum nodes displacement in a given load condition.

The multi-objective structural model can be expressed as

Minimize $WT(A)$

subject to $\sigma(A) \leq [\sigma]$

$A_{\text{min}} \leq A \leq A_{\text{max}}$

Where $A=[A_1, A_2, ..., A_n]^T$ are the design variables for the cross section, $n$ is the group number of design variables for the cross section bar, $WT(A)$ is the total weight of the structure, $\sigma(A)$ is the deflection of the loaded joint, where $L_i, A_i$ and $\rho_i$ are the bar length, cross section area and density of the $i^{th}$ group bars respectively. $\sigma(A)$ is the stress constraint and $[\sigma]$ is allowable stress of the group bars under various conditions, $A_{\text{min}}$ and $A_{\text{max}}$ are the lower and upper bounds of cross section area A respectively.

3. MATHEMATICAL PRELIMINARIES
3.1 Fuzzy Set
Let $X$ denotes a universal set. Then the fuzzy subset $A$ in $X$ is a subset of order pairs $\tilde{A} = \{(x, \mu_A(x)) : x \in X\}$ where $\mu_A : X \rightarrow [0, 1]$ is called the membership function which assigns a real number $\mu_A(x)$ in the interval $[0, 1]$ to each element $x \in X$. $A$ is non-fuzzy and $\mu_A(x)$ is identical to the characteristic function of crisp set. It is clear that the range of membership function is a subset of non-negative real numbers.

3.2 Intuitionistic Fuzzy Set
Let $X = \{x_1, x_2, ..., x_n\}$ be a finite universal set. An intuitionistic fuzzy set (IFS) set $A'$ in the sense of Atanassov [3] is given by equation $A' = \{< x, \mu_A(x), \nu_A(x) > : x \in X \}$ where the function $\mu_A(x') : X \rightarrow [0, 1]$; $x_i \in X \rightarrow \mu_A(x_i) \in [0, 1]$ and $\nu_A(x') : X \rightarrow [0, 1]$ define the degree of membership and degree of non-membership of an element $x_i \in X$ to the set $A' \subseteq X$, such that they satisfy the condition $0 \leq \mu_A(x_i) + \nu_A(x_i) \leq 1, \forall x_i \in X$. For each IFS $A'$ in $X$ the amount $\Pi(x_i) = 1 - (\mu_A(x_i) + \nu_A(x_i))$ is called the degree of uncertainty (or hesitation) associated with the membership of elements $x_i \in X$ in $A'$ we call it intuitionistic fuzzy index of $A'$ with respect to an element $x_i \in X$.

3.3 $\alpha$ – Level set or $\alpha$ – cut of a Fuzzy Set
The $\alpha$ – level set of a fuzzy set $A$ of $X$ is a crisp set $A_{\alpha}$ which contains all the elements of $X$ that have membership values greater than or equal to $\alpha$. i.e. $A = \{x : \mu_A(x) \geq \alpha, x \in X, \alpha \in [0, 1]\}$.

3.4 $(\alpha, \beta)$ cut of an Intuitionistic Fuzzy Set
A set of $(\alpha, \beta)$-cut generated by IFS $A'$ where $\alpha, \beta \in [0, 1]$ are fixed number such that $\alpha + \beta \leq 1$ is denoted by

$\tilde{A}_{\alpha, \beta} = \{< x, \mu_A(x), \nu_A(x) > : x \in X, \mu_A(x) \geq \alpha, \nu_A(x) \leq \beta, \alpha, \beta \in [0, 1]\}$

and defined as the crisp set of element $x$ which belong to $\tilde{A}$ at least to the degree $\alpha$ and which belong to $\tilde{A}$ at most to the degree $\beta$.

3.5 Triangular Norm (T-Norm)
$T : [0, 1] \times [0, 1] \rightarrow [0, 1]$ is said to be $t$-norm if it satisfies the following properties

i) $T(a, b) = T(b, a) \forall a, b \in [0, 1]$ (commutativity)

ii) $T(T(a, b), c) = T(a, T(b, c)) \forall a, b, c \in [0, 1]$ (Associativity)

iii) $T(a, b) \leq T(a, c) \forall b, c \in [0, 1]$ (Monotonicity)

iv) $T(0, 0) = T(1, 1) = 1$

v) $T(a, 1) = a \forall a \in [0, 1]$(Identity)

3.6 Extended n-ary Triangular Norm
For the purpose of operations of multiple fuzzy sets it is useful to define the notation of multidimensional t-norms. Let $[0, 1]$ be a $n$-dimensional cube and $(x_1, x_2, ..., x_n)$ and $(y_1, y_2, ..., y_n) \in [0, 1]$. A mapping $T : [0, 1]^n \rightarrow [0, 1]$ is called $n$-dimensional t-norm if it satisfies the following properties.

i) $T(x_1, x_2, ..., x_n, x_{n+1}) = T(T(x_1, x_2, ..., x_n), x_{n+1})$

ii) $T(T(x_1, x_2, ..., x_n), x_{n+1}, x_{n+2}, ..., x_{2n})$

$T(x_1, x_2, ..., x_n, x_{n+1})$

$= T(x_1, x_2, ..., x_n, T(x_{n+1}, x_{n+2}, ..., x_{2n}))$
iii) For \((x_i, x_{i+1}, x_{i+j}) \leq (z_i, z_{i+j}, z_{i+j}) \Rightarrow T(x_i, x_{i+1}, x_{i+j}) \leq T(z_i, z_{i+j}, z_{i+j})\) with \(x_i = z_i\) for some \(i\) and \(x_j = z_j\) for some \(j = 1, 2, ..., n\)

iv) \(T(0, 0, ..., 0) = 0, T(1, 1, ..., 1) = 1\)

v) \(T(1, 1, ..., 1) = x_i\)

3.7 Properties of Extended n -ary Triangular Norm (T-Norm)

Due to associative law it is easy to extend a triangular norm \(T\) into \(n\) arguments the \(n\)-ary operation \(T_n\) on \([0,1]\) satisfies the following properties

i) \(T_n(\sigma(x_1, x_2, ..., x_n)) = T_n(x_\sigma(1), x_\sigma(2), ..., x_\sigma(n))\) where \(\sigma\) is a permutation of \([1, 2, ..., n]\) (Commutativity)

ii) \(T_n(x_1, x_2, ..., x_n) = T_{n-1}(x_1, x_2, ..., x_{n-1}, T_n(x_{n-1}, x_n))\)

\(= T_{n-1}(T(x_{n-1}, x_n), x_1, ..., x_{n-2})\)

\((\forall i \in N_n)(x_i \leq x_{i+1}) \Rightarrow T_n(x_1, x_2, ..., x_n) \leq T_n(x_1, x_2, ..., x_n)\) (monotonicity)

iii) \(T_n(x_1, x_2, ..., x_n) \leq T_n(x_1, x_2, ..., x_n)\)

\(= T(x_1, x_2, ..., x_{n-1}, T_n(x_{n-1}, x_n))\)

(IdENTITY Law)

A t-norm \(T_n\) is said to be continuous if \(T\) is continuous on \([0,1]\). From the above, we may call \(T_n\) an extension of triangular norm. In the sequel we omit number of argument \(n\) and simply write \(T\) of the class of mapping generated by triangular norm \(T\).

3.8 Triangular Conorm (T-Conorm)

\(S:\{0,1\} \times \{0,1\} \rightarrow \{0,1\}\) is said to be t-conorm if it satisfies the following properties

i) \(S(a, b) = S(b, a) \land a, b \in \{0,1\}\) (commutativity)

ii) \(S(S(a, b), c) = S(a, S(b, c)) \land a, b, c \in \{0,1\}\) (associativity)

iii) \(S(a, b) \leq S(a, c)\) with \(b \leq c \land a, b, c \in \{0,1\}\) (Monotonicity)

iv) \(S(0, 0) = 0, S(1, 1) = 1\)

v) \(S(a, 0) = a \land a \in \{0,1\}\) (Identity)

3.9 Extended n -ary Triangular Conorm (T-Conorm)

For the purpose of operations of multiple fuzzy sets it is useful to define the notation of multidimensional t-norms. Let \([0,1]\) be a \(n\)-dimensional cube and \((x_1, x_2, ..., x_n)\) and \((z_1, z_2, ..., z_n)\) \(\in \{0,1\}^n\). A mapping \(S: \{0,1\}^n \rightarrow \{0,1\}\) is called \(n\)-dimensional t-norm if it satisfies the following properties.

i) \(S(x_1, x_2, ..., x_{i-1}, x_i, x_{i+1}, ..., x_n) \leq S(x_1, x_2, ..., x_{i-1}, x_i, x_{i+1}, ..., x_n)\)

ii) \(S(S(x_1, x_2, ..., x_{i-1}, x_i, x_{i+1}, ..., x_n), S(x_{i+1}, x_{i+2}, ..., x_n)) = S(x_1, x_2, ..., x_{n-1}, x_n)\)

iii) For \((x_1, x_2, ..., x_{i-1}, x_i) \leq (z_1, z_2, ..., z_{i-1}, z_i) \Rightarrow S(x_1, x_2, ..., x_{i-1}, x_i) \leq S(z_1, z_2, ..., z_{i-1}, z_i)\)

\(= S(x_1, x_2, ..., x_{n-1}, x_n)\)

\(\text{where } x_i = z_i\) for some \(i \in \{1, 2, ..., n\}\)

iv) \(S(0, 0, ..., 0) = 0, S(1, 1, ..., 1) = 1\)

v) \(S(0, 0, ..., x_i, 0) = x_i\)

3.10 Properties of Extended n -ary Triangular Conorm (T-Conorm)

Due to associative law it is easy to extend a triangular norm \(S\) into \(n\) arguments the \(n\)-ary operation \(S_n\) on \([0,1]\) satisfies the following properties

i) \(S_n(x_1, x_2, ..., x_n) = S_n(x_1, x_2, ..., x_n)\) where \(\sigma\) is a permutation of \([1, 2, ..., n]\) (Commutativity)

ii) \(S_n(x_1, x_2, ..., x_n, x_{n+1}) = S_n(x_1, x_2, ..., x_n, x_{n+1})\)

\(= S_{n-1}(S_n(x_1, x_2, ..., x_n), x_{n+1})\)

(IdENTITY Law)

A t-conorm \(S_n\) is said to be continuous if \(S\) is continuous on \([0,1]\). From the above, we may call \(S_n\) an extension of triangular norm. In the sequel we omit number of argument \(n\) and simply write \(S\) of the class of mapping generated by triangular norm \(S\).

3.11 Four Basic T-norm and T-conorm and their Generalization with Weight

Let \(\lambda_j^i\) be an intuitionistic fuzzy set for \(j = 1, 2, ..., n\).

i) Minimum t-norm and maximum t-conorm

The intuitionistic fuzzy minimum t-norm and maximum t-conorm can be defined as

\(S\left(S\left(x_1, x_2, ..., x_n\right), S\left(y_1, y_2, ..., y_n\right)\right)\)

\(= \min\{\mu(x_1), \mu(y_1)\} \land \min\{\nu(x_1), \nu(y_1)\}\)

Similarly n-ary intuitionistic fuzzy minimum t-norm and maximum t-co-norm

with weight can be defined as
with weight \( \lambda \) can be defined as

\[
T^w_\lambda (w_1, \mu_1(x_1); w_2, \mu_2(x_2); \ldots; w_n, \mu_n(x_n)) = \begin{cases} 
\min(w_i \mu_i(x_i)) & \text{if } \max(w_i \mu_i(x_i)) = 1 \\
0 & \text{otherwise}
\end{cases}
\]

\[
S^w_\lambda (w_1, \nu_1(x_1); w_2, \nu_2(x_2); \ldots; w_n, \nu_n(x_n)) = \begin{cases} 
\max(w_i \nu_i(x_i)) & \text{if } \min(w_i \nu_i(x_i)) = 0 \\
1 & \text{if } \min(w_i \nu_i(x_i)) > 0
\end{cases}
\]

3.12 Some Particular Classes of T-norms and T-co-norms

A t-norm and t-co-norm is commutative order semi-group with unit element 1 on \([0,1]\) of real numbers. So the class of t-norm and t-co-norm is quite large. Two well-known class of t-norm and t-co-norm are discussed here.

Yager (1980) introduced the following classes of t-norms and t-co-norms

\[
T^w_\lambda (\mu_1(x_1), \mu_2(x_2)) = 1 - \min \left[ 1 - \left( 1 - \mu_1(x_1) \right)^{\lambda} + \left( 1 - \mu_2(x_2) \right)^{\frac{1}{\lambda}} \right] \quad \forall \lambda \in [0,\infty)
\]

and

\[
S^w_\lambda (\nu_1(x_1), \nu_2(x_2)) = \min \left[ 1 - \left( \nu_1(x_1) \right)^{\lambda} + \left( \nu_2(x_2) \right)^{\frac{1}{\lambda}} \right] \quad \forall \lambda \in [0,\infty)
\]

Extended n-ary form of above t-norm is

\[
T^w_\lambda (\mu_1(x_1), \ldots, \mu_n(x_n)) = 1 - \min \left[ 1 - \left( \sum_{i=1}^{n} \mu_i(x_i) \right)^{\lambda} \right] \quad \forall \lambda \in [0,\infty)
\]

and

\[
S^w_\lambda (\nu_1(x_1), \ldots, \nu_n(x_n)) = \min \left[ 1 - \left( \sum_{i=1}^{n} \nu_i(x_i) \right)^{\lambda} \right] \quad \forall \lambda \in [0,\infty)
\]

The extended form with different weights of the above t-norms and t-co-norms are

\[
T^w_\lambda (w_1, \mu_1(x_1); w_2, \mu_2(x_2); \ldots; w_n, \mu_n(x_n)) = 1 - \min \left[ 1 - \left( \sum_{i=1}^{n} w_i \mu_i(x_i) \right)^{\lambda} \right] \quad \forall \lambda \in [0,\infty)
\]

and

\[
S^w_\lambda (w_1, \nu_1(x_1); w_2, \nu_2(x_2); \ldots; w_n, \nu_n(x_n)) = \min \left[ 1 - \left( \sum_{i=1}^{n} w_i \nu_i(x_i) \right)^{\lambda} \right] \quad \forall \lambda \in [0,\infty)
\]
\[ S_i^f (w_1, u_1(x_1); w_2, u_1(x_2); ..., w_n, u_1(x_n)) \]
\[ = \min \left[ 1, \left\{ \sum_{i=1}^n (w_{i, u_1(x_i)})^\lambda \right\}^\frac{1}{\lambda} \right] \quad \forall \lambda \in [0, \infty) \]

It can be proved that
\[ \lim \limits_{\lambda \to \infty} T_i^f (\mu_1(x), \mu_2(x), ..., \mu_n(x)) = T_{i, u} (\mu_1(x), \mu_2(x), ..., \mu_n(x)) \quad \forall \lambda \in [0, \infty) \]

Proof of (Ia) is given in the paper Dey and Roy [10]

\[ \lim \limits_{\lambda \to \infty} T_i^f (\mu_1(x), \mu_2(x), ..., \mu_n(x)) = T_{i, u} (\mu_1(x), \mu_2(x), ..., \mu_n(x)) \quad \forall \lambda \in [0, \infty) \]

Proof of (Ia) is given in the paper Dey and Roy [10]

\[ \lim \limits_{\lambda \to \infty} S_i^f (u_1(x_1), u_2(x_2), ..., u_n(x_n)) = S_{i, u} (u_1(x_1), u_2(x_2), ..., u_n(x_n)) \quad \forall \lambda \in [0, \infty) \]

Proof of (Ib)

Case I.

Let \( u_1(x_1) = u_2(x_2) = ... = u_n(x_n) \neq 1 \)

Then
\[ \lim \limits_{\lambda \to \infty} S_i^f (u_1(x_1), u_2(x_2), ..., u_n(x_n)) \]
\[ = \min \left[ 1, \lim \limits_{\lambda \to \infty} \left\{ \sum_{i=1}^n (u_{i, x_i})^\lambda \right\}^\frac{1}{\lambda} \right] \]
\[ = \min \left[ 1, \lim \limits_{\lambda \to \infty} \left\{ n^\lambda (u_{1, x_1})^\lambda \right\}^\frac{1}{\lambda} \right] \]
\[ = u_{1, x_1} \]
\[ = \max \{ u_1(x_1), u_2(x_2), ..., u_n(x_n) \} \]
\[ = S_{i, u} (u_1(x_1), u_2(x_2), ..., u_n(x_n)) \]

Case II.

Let \( u_1(x_1) = u_2(x_2) = ... = u_n(x_n) = 1 \)

Then
\[ \lim \limits_{\lambda \to \infty} S_i^f (u_1(x_1), u_2(x_2), ..., u_n(x_n)) \]
\[ = \min \left[ 1, \left\{ \sum_{i=1}^n (u_{i, x_i})^\lambda \right\}^\frac{1}{\lambda} \right] \]
\[ = \min \{ 1, 1 \} \]
\[ = \max \{ u_1(x_1), u_2(x_2), ..., u_n(x_n) \} \]
\[ = S_{i, u} (u_1(x_1), u_2(x_2), ..., u_n(x_n)) \]

Case III.

Let \( u_i(x_i) \neq u_j(x_j) \) for \( i, j = 1, 2, ..., n, i \neq j \). Without loss of generality let us consider
\[ u_1(x_1) > u_2(x_2) > ... > u_n(x_n) \]

Let \( P = \left( \sum_{i=1}^n (u_{i, x_i})^\lambda \right)^\frac{1}{\lambda} \)

Then \( \lim P = \lim P = \lim \left( \sum_{i=1}^n (u_{i, x_i})^\lambda \right)^\frac{1}{\lambda} \)

\[ = \lim \left( \sum_{i=1}^n (u_{i, x_i})^\lambda \right)^\frac{\infty \text{ form}}{\lambda} \]
\[ = \lim \left( \sum_{i=1}^n (u_{i, x_i})^\lambda \right)^\frac{\ln (u_{i, x_i})^\lambda + \sum_{i=1}^n \left( \frac{u_{i, x_i}}{u_i} \right)^\lambda}{\sum_{i=1}^n (u_{i, x_i})^\lambda} \]
\[ = \ln u_{1, x_1} \]
\[ \lim P = u_{1, x_1} \]
\[ = \max \{ u_1(x_1), u_2(x_2), ..., u_n(x_n) \} \]
\[ = S_{i, u} (u_1(x_1), u_2(x_2), ..., u_n(x_n)) \]

Proof of (Iib)

Case I.

Let \( u_i(x_i) = ... = u_i(x_i) = u_i(x_i) = 0 \) and \( u_1(x_1) > 0 \)

Then
\[ \lim S_i^f (u_1(x_1), u_2(x_2), ..., u_n(x_n)) \]
\[ = \lim \left[ 1, \left\{ \sum_{i=1}^n (u_{i, x_i})^\lambda \right\}^\frac{1}{\lambda} \right] \]

= \[ \min \{ 1, 1 \} \]
\[ = \max \{ u_1(x_1), u_2(x_2), ..., u_n(x_n) \} \]
\[ = S_{i, u} (u_1(x_1), u_2(x_2), ..., u_n(x_n)) \]

39
The extended form with different weights of the above t-norms and t- conorms are
\[ T^{\lambda}_{\alpha}(w_1, \mu_1(x_1); w_2, \mu_2(x_2); \ldots; w_n, \mu_n(x_n)) \]
\[ = \frac{\prod_{i=1}^{n}(\mu_i(x_i))^{w_i}}{\lambda + (1 - \lambda)\left[1 - \prod_{i=1}^{n}(1 - \mu_i(x_i))\right]} \quad \forall \lambda \in [0, \infty) \]
and
\[ S^{\lambda}_{\alpha}(w_1, \nu_1(x_1); w_2, \nu_2(x_2); \ldots; w_n, \nu_n(x_n)) \]
\[ = \frac{\sum_{i=1}^{n}w_i\nu_i(x_i)}{1 - (1 - \lambda)\prod_{i=1}^{n}(1 - \nu_i(x_i))} \quad \lambda \geq 0 \]

It can be prove that
\[ \lim_{\lambda \to 0} T^{\lambda}_{\alpha}(\mu_1(x_1), \mu_2(x_2), \ldots, \mu_n(x_n)) = T_{\alpha}(\mu_1(x_1), \mu_2(x_2), \ldots, \mu_n(x_n)) \quad \forall \lambda \in [0, \infty) \]

Proof of (Ia) is given in the paper Dey and Roy [10]
\[ \lim_{\lambda \to 0} S^{\lambda}_{\alpha}(\mu_1(x_1), \mu_2(x_2), \ldots, \mu_n(x_n)) = S_{\alpha}(\mu_1(x_1), \mu_2(x_2), \ldots, \mu_n(x_n)) \quad \forall \lambda \in [0, \infty) \]

Proof of (Ib) is given in the paper Dey and Roy [10]
\[ \lim_{\lambda \to 0} T^{\lambda}_{\alpha}(\nu_1(x_1), \nu_2(x_2), \ldots, \nu_n(x_n)) = T_{\alpha}(\nu_1(x_1), \nu_2(x_2), \ldots, \nu_n(x_n)) \quad \forall \lambda \in [0, \infty) \]

Proof of (Ib) is given in the paper Dey and Roy [10]
5. MATHEMATICAL ANALYSIS

5.1 Intuitionistic Fuzzy Non-linear Programming Optimization with Different Weighted T-norm and T-conorm Operator to Solve Multi-Objective Non-linear Programming Problem

A multi-objective non-linear parametric intuitionistic programming (MONLP) Problem can be formulated as

\[
\text{Minimize } \begin{bmatrix} f_1(x), f_2(x), \ldots, f_p(x) \end{bmatrix}^T
\]

Subject to \( g_j(x) \leq b_j \); \( j = 1, 2, \ldots, m \)

\( x > 0 \)

Following Zimmermann [11], we have presented a solution algorithm to solve the MONLP Problem by fuzzy optimization technique.

Step-1: Solve the MONLP (2) as a single objective non-linear programming problem to by taking one of the objective at a time and ignoring the others. These solutions are known as ideal solutions. Let \( x_i^* \) be the respective optimal solution for the \( i^{th} \) different objectives with same constraints and evaluate each objective values for all these \( i^{th} \) optimal solutions.

Step-2: From the result of step 1 determine the corresponding values for every objective for each derived solutions. With the values of all objectives at each ideal solutions, pay-off matrix can be formulated as follows

\[
\begin{bmatrix}
  f_1(x) & f_2(x) & \cdots & f_p(x) \\
  f_1^*(x^1) & f_2^*(x^1) & \cdots & f_p^*(x^1) \\
  f_1^*(x^2) & f_2^*(x^2) & \cdots & f_p^*(x^2) \\
  \vdots & \vdots & \ddots & \vdots \\
  f_1^*(x^p) & f_2^*(x^p) & \cdots & f_p^*(x^p)
\end{bmatrix}
\]

Here \( x^1, x^2, \ldots, x^p \) are the ideal solution of the objectives \( f_1(x), f_2(x), \ldots, f_p(x) \) respectively.

Step-3: From the result of step 2 now we find lower bound (minimum) \( L_i^{\text{ACC}} \) and upper bound (maximum) \( U_i^{\text{ACC}} \) by using following rule

\[
U_i^{\text{ACC}} = \max \left\{ f_i(x^P) \mid L_i^{\text{ACC}} = \min \left\{ f_i(x^P) \right\} \right\}
\]

where \( 1 \leq i \leq p \).

But in IFON The degree of non-membership (rejection) and the degree of membership (acceptance) are considered so that the sum of both value is less than one. To define the non-membership of NLP problem let \( L_i^{\text{Rej}} \) and \( U_i^{\text{Rej}} \) be the upper bound and lower bound of objective function \( f_i(x) \) where

\[
L_i^{\text{ACC}} \leq L_i^{\text{Rej}} \leq U_i^{\text{Rej}} \leq U_i^{\text{ACC}}
\]

For objective function of minimization problem the upper bound for non-membership function (rejection) is always equals to that the upper bound of membership function (acceptance). One can take lower
bound for non-membership function as follows

\[ L_i^{Re} = L_i^{Acc} + \epsilon_i \] where \( 0 < \epsilon_i < (U_i^{Acc} - L_i^{Acc}) \) based on the decision maker choice.

The initial intuitionistic fuzzy model with aspiration level of objectives becomes 

\[ \text{Find } \{ x_i, i = 1, 2, \ldots, p \} \]

so as to satisfy \( f_i(x) \leq L_i^{Re} \) with tolerance

\[ L_i^{Re} = (U_i^{Acc} - L_i^{Acc}) \] for the degree of acceptance for \( i = 1, 2, \ldots, p \).

\[ f_i(x) \geq U_i^{Re} \] with tolerance

\[ U_i^{Re} = (U_i^{Acc} - L_i^{Acc}) \] for degree of rejection for \( i = 1, 2, \ldots, p \). Define the membership (acceptance) and non-membership (rejection) functions of above uncertain objectives as follows. For the \( p \), \( i = 1, 2, \ldots, p \) objectives functions the linear membership function \( \mu_i(f_i(x)) \) and linear non-membership \( v_i(f_i(x)) \) is defined as follows

\[
\begin{align*}
\mu_i(f_i(x)) &= \begin{cases} 
1 & \text{if } f_i(x) \leq L_i^{Re} \\
\frac{1 - e^{-\frac{(f_i(x) - L_i^{Re})}{\epsilon_i}}}{1 - e^{-\frac{(U_i^{Acc} - L_i^{Acc})}{\epsilon_i}}} & \text{if } L_i^{Re} < f_i(x) < U_i^{Acc} \\
0 & \text{if } f_i(x) \geq U_i^{Acc}
\end{cases} \\
v_i(f_i(x)) &= \begin{cases} 
0 & \text{if } f_i(x) < U_i^{Re} \\
\left(\frac{f_i(x) - U_i^{Re}}{U_i^{Acc} - U_i^{Re}}\right)^2 & \text{if } U_i^{Re} < f_i(x) < U_i^{Acc} \\
1 & \text{if } f_i(x) \geq U_i^{Acc}
\end{cases}
\end{align*}
\]

After determining the different membership functions for each of the objective functions, one can adopt following three type of decisions

i) According to the extension of the weighted intuitionistic min-max operator the MONLP (2) can be formulated as

\[
\begin{align*}
\text{Maximize } & \mu_{D_1}(x;w) \\
\text{Minimize } & v_{D_1}(x;w)
\end{align*}
\]

\[
\begin{align*}
\text{such that } & 0 \leq \mu_i(f_i(x)) + v_i(f_i(x)) \leq 1; \text{ for } i = 1, 2, \ldots, p. \\
\mu_i(f_i(x)) & \geq v_i(f_i(x)), \text{ for } i = 1, 2, \ldots, p. \\
\mu_i(f_i(x)) & \in [0,1], v_i(f_i(x)) \in [0,1]; \text{ for } i = 1, 2, \ldots, p. \\
g_j(x) & \leq b_j; \text{ for } j = 1, 2, \ldots, m.
\end{align*}
\]

According to Angelov [1] the above problem can be formulated as

\[
\begin{align*}
\text{Maximize } & (\alpha - \beta) \\
\text{Minimize } & \sum_{i=1}^{p} w_i \mu_i(f_i(x)) - \beta; \text{ for } i = 1, 2, \ldots, p. \\
g_j(x) & \leq b_j; \text{ for } j = 1, 2, \ldots, m.
\end{align*}
\]

ii) According to the extension of the weighted intuitionistic Yager (1980) operator the MONLP (2) can be formulated as

\[
\begin{align*}
\text{Maximize } & \lambda \mu_{D_2}(x;w) \\
\text{Minimize } & \lambda v_{D_2}(x;w)
\end{align*}
\]

\[
\begin{align*}
\text{Subject to the same constraint as (i)} \\
\text{such that } & 0 \leq \mu_i(f_i(x)) + v_i(f_i(x)) \leq 1; \text{ for } i = 1, 2, \ldots, p. \\
\mu_i(f_i(x)) & \geq v_i(f_i(x)), \text{ for } i = 1, 2, \ldots, p. \\
\mu_i(f_i(x)) & \in [0,1], v_i(f_i(x)) \in [0,1]; \text{ for } i = 1, 2, \ldots, p. \\
g_j(x) & \leq b_j; \text{ for } j = 1, 2, \ldots, m.
\end{align*}
\]

\[
\begin{align*}
\text{Step-4: Solving any of the above two we will get the optimal solution of MONLP (2).}
\end{align*}
\]

5.2 Pareto Optimality Test

A numerical test of Pareto optimality for \( x^* \) can be performed by solving the following problem

\[
\begin{align*}
\text{Maximize } & R = \sum_{i=1}^{p} \tilde{\xi}_i \\
\text{subject to } & f_i(x) + \tilde{\xi}_i = f_i(x^*); \text{ for } i = 1, 2, \ldots, p. \\
x \in X, \tilde{\xi}_i \geq 0; \text{ for } i = 1, 2, \ldots, p.
\end{align*}
\]
The optimal solution of (3), say $x^*$ and $f_i(x^*)$ are called strong Pareto optimal. Solution provided $\xi_i$ is very small, otherwise it is called weak Pareto-optimal Solution

6. SOLUTION OF MULTI-OBJECTIVE STRUCTURAL OPTIMIZATION PROBLEM BY INTUITIONISTIC FUZZY OPTIMIZATION TECHNIQUE

To solve the MOSOP (1) step 1 of 5.1is used. After that according to step 2 pay-off matrix is formulated

$$\begin{align*}
&\text{WT}(A) \\
&\delta(A)
\end{align*}$$

A$$
\begin{align*}
&\text{WT}(A) \\
&\delta(A)
\end{align*}$$

In next step following step 2 we calculate the bound of the objective

$$U_{\text{ACC}} \in \text{WT}$$

and

$$I_{\text{RE}j} \in \text{WT}$$

for weight function

$$\text{WT}(A)$$

such that

$$\text{LT} \in \text{WT}(A) < U_{\text{ACC}}$$

and

$$I_{\text{RE}j} < \text{WT}(A) < U_{\text{RE}j}$$

for deflection $\delta(A)$, such that

$$\text{LT} \in \delta(A) < U_{\text{ACC}}$$

and

$$I_{\text{RE}j} < \delta(A) < U_{\text{RE}j}$$

with the condition $U_{\text{ACC}} = U_{\text{RE}j}$.

According to IFO technique considering membership and non-membership function for MOSOP (1)

$$\begin{align*}
&\mu_{\text{WT}}(\text{WT}(A)) \\
&= \begin{cases} \\
&1 \quad \text{if} \quad \text{WT}(A) \leq L_{\text{ACC}} \\
&0 \quad \text{if} \quad \text{WT}(A) \geq U_{\text{ACC}} \\
&-e^{-T}\left(\frac{\text{WT}(A) - L_{\text{ACC}}}{U_{\text{ACC}} - L_{\text{ACC}}}\right) - e^{-T} \quad \text{if} \quad L_{\text{ACC}} \leq \text{WT}(A) \leq U_{\text{ACC}}
\end{cases}
\end{align*}$$

and

$$\begin{align*}
&\nu_{\text{WT}}(\text{WT}(A)) \\
&= \begin{cases} \\
&0 \quad \text{if} \quad \text{WT}(A) \leq I_{\text{RE}j} \\
&1 \quad \text{if} \quad \text{WT}(A) \geq I_{\text{RE}j} \\
&\left(\frac{\text{WT}(A) - I_{\text{RE}j}}{U_{\text{RE}j} - I_{\text{RE}j}}\right)^2 - e^{-T} \quad \text{if} \quad I_{\text{RE}j} \leq \text{WT}(A) \leq U_{\text{RE}j}
\end{cases}
\end{align*}$$

and

$$\begin{align*}
&\mu_{\delta}(\delta(A)) \\
&= \begin{cases} \\
&1 \quad \text{if} \quad \delta(A) \leq L_{\text{ACC}} \\
&0 \quad \text{if} \quad \delta(A) \geq U_{\text{ACC}} \\
&-e^{-T}\left(\frac{\delta(A) - L_{\text{ACC}}}{U_{\text{ACC}} - L_{\text{ACC}}}\right) - e^{-T} \quad \text{if} \quad L_{\text{ACC}} \leq \delta(A) \leq U_{\text{ACC}}
\end{cases}
\end{align*}$$

After determining the different membership functions for each of the objective functions, one can adopt following three types of decisions

i) According to the extension of the weighted intuitionistic min-max operator the MONLP (2) can be formulated as

Maximize $(\alpha - \beta)$

$$w_1\left(\mu_{\text{WT}}(\text{WT}(A))\right) \geq \alpha; w_2\left(\mu_{\delta}(\delta(A))\right) \geq \alpha;$$

Maximize $$\sigma(A) \leq \alpha;$$

$$A^\text{MIN} \leq A \leq A^\text{MAX};$$

$$w_1 \geq 0, w_2 \geq 0, w_1 + w_2 = 1; w_1, w_2 \in [0,1]$$

$$0 \leq \alpha + \beta \leq 1; \alpha \geq \beta; \alpha, \beta \in [0,1]$$

ii) According to extension of weighted Yager operator with $\lambda = 2$

Maximize $$\left[1, \sqrt{w_1\left(1 - \mu_{\text{WT}}(\text{WT}(A))\right) + w_2\left(1 - \mu_{\delta}(\delta(A))\right)}\right]$$

such that

$$0 \leq \mu_{\text{WT}}(\text{WT}(A)) + \nu_{\text{WT}}(\text{WT}(A)) \leq 1;$$

$$0 \leq \mu_{\delta}(\delta(A)) + \nu_{\delta}(\delta(A)) \leq 1;$$

$$\mu_{\text{WT}}(\text{WT}(A)) \geq \nu_{\text{WT}}(\text{WT}(A));$$

$$\mu_{\delta}(\delta(A)) \geq \nu_{\delta}(\delta(A));$$

$$\sigma(A) \leq \alpha;$$

$$\lambda_{\text{MIN}} \leq \lambda \leq \lambda_{\text{MAX}};$$

$$w_1 \geq 0, w_2 \geq 0, w_1 + w_2 = 1; w_1, w_2 \in [0,1]$$

$$w_1 \geq 0, w_2 \geq 0, w_1 + w_2 = 1; w_1, w_2 \in [0,1]$$

$$0 \leq \alpha + \beta \leq 1; \alpha \geq \beta; \alpha, \beta \in [0,1]$$

iii) According to extension of weighted Hamacher operator with $\lambda = 1.5$

Maximize $$\left[1, \sqrt{w_1\left(1 - \mu_{\text{WT}}(\text{WT}(A))\right) + w_2\left(1 - \mu_{\delta}(\delta(A))\right)}\right] $$

such that

$$0 \leq \mu_{\text{WT}}(\text{WT}(A)) + \nu_{\text{WT}}(\text{WT}(A)) \leq 1;$$

$$0 \leq \mu_{\delta}(\delta(A)) + \nu_{\delta}(\delta(A)) \leq 1;$$

$$\mu_{\text{WT}}(\text{WT}(A)) \geq \nu_{\text{WT}}(\text{WT}(A));$$

$$\mu_{\delta}(\delta(A)) \geq \nu_{\delta}(\delta(A));$$

$$\sigma(A) \leq \alpha;$$

$$\lambda_{\text{MIN}} \leq \lambda \leq \lambda_{\text{MAX}};$$

$$w_1 \geq 0, w_2 \geq 0, w_1 + w_2 = 1; w_1, w_2 \in [0,1]$$

$$0 \leq \alpha + \beta \leq 1; \alpha \geq \beta; \alpha, \beta \in [0,1]$$
Minimize

\[
\frac{w_{\mu(A)} \{WT(A)\} + w_{\sigma(A)} \{\delta(A)\} - 0.5 \{\sigma(A)\}^a}{1 + 0.5 \{\sigma(A)\}^a}
\]

subject to the same constraint as (6.1)

7. NUMERICAL ILLUSTRATION

A well-known three bar planar truss structure is considered. The design objective is to minimize weight of the structure \(WT(A, A_i)\) and minimize the deflection \(\delta(A, A_i)\) along \(x\) - axis and \(y\) - axis at loading point of a statistically loaded three bar planar truss subject stress \(\sigma\) constraints on each of the truss members.

![Figure 1. Design of three bar planar truss](image)

The multi-objective optimization problem can be stated as follows

Minimize \(WT(A, A_i) = \rho L(2A_1 + A_i)\) \(10\)

Minimize \(\delta_{1}(A, A_i) = \frac{\rho L(2A_1 + A_i)}{E(2A_1^2 + 2AA_i)}\)

Minimize \(\delta_{2}(A, A_i) = \frac{\rho LA_i}{E(2A_1^2 + 2AA_i)}\)

such that

\[\sigma_i(A, A_i) = \frac{P(2A_1 + A_i)}{2A_1^2 + 2AA_i} \leq [\sigma_i^\tau]\]

\[\sigma_i(A, A_i) = \frac{P}{\sqrt{2}(A + A_i)} \leq [\sigma_i^\epsilon]\]

\[\sigma_i(A, A_i) = \frac{\rho A_i}{2(2A_1^2 + 2AA_i)} \leq [\sigma_i^c]\]

\[A^{\text{max}} \leq A \leq A^{\text{max}} \ i = 1, 2\]

Where \(P\) = applied load ; \(\rho\) = material density; \(L =\) length ; \(E =\) Young’s modulus ; \(A_1 =\) cross sectional area of bar-land bar-3. \(A_i =\) cross sectional area of bar-2. \(\delta_{1}\) and \(\delta_{2}\) are the deflection of loaded joint along \(x\) and \(y\) axes respectively. \([\sigma_i^\tau]\) and \([\sigma_i^\epsilon]\) are the maximum allowable tensile stress for bar-1 and bar-2 respectively. \([\sigma_i^c]\) is maximum allowable compressive stress for bar -3.

The optimal results of model (10) using t-norms and t-conorms are shown in table 2 to 5 and Pareto optimal solution is shown in table 6.

In table 2, for equal importance, the extension of weighted parameterized Hamecher-t-norm t-co-norm operator gives minimum structural weights as well as minimum deflection.

In table 3, for more importance on structural weight, the extension of weighted parameterized Hamacher-t-norm t-co-norm operator gives minimum structural weights as well as minimum deflection.

In table 4, for more importance on deflection, the extension of weighted parameterized Hamacher t-norm t-co-norm operator gives minimum structural weights where as weighted parameterized min-max t-norm t-co-norm operator gives minimum deflection.

In table 5, for more importance on deflection, the extension of weighted parameterized Hamacher-t-norm t-co-norm operator gives minimum structural weights and minimum deflection.

8. CONCLUSIONS
In this paper, we have proposed a method to solve multi-objective structural model in intuitionistic fuzzy environment. Here binary t-norms are expressed in extended n-ary t-norms and discussed their basic properties and some special cases. The said model is solved by using t-norms and t-conorm based on intuitionistic fuzzy optimization technique. A main advantage of the proposed method is that it allows the user to concentrate on the actual limitations in a problem during the specification of the flexible objectives. This approximation method can be applied to optimize different models in various fields of engineering and sciences.
