Abstract

This technical paper contains the information about the most commonly used smart phones and the operating systems that are used by these smart phones. After this a brief introduction of the android and IOS operating system has been described. A basic comparison between these has been started by. The technical comparison has been made by describing the core architecture of applications and the system management, inter-process communication, system calls, virtualization, memory management and power management. The comparisons of these Operating Systems have been made by different aspects that clarify the main differences between both.
