ABSTRACT

Automated essay grading or scoring systems are not more a myth they are reality. As on today, the human written (not hand written) essays are corrected not only by examiners / teachers also by machines. The TOEFL exam is one of the best examples of this application. The students’ essays are evaluated both by human & web based automated essay grading system. Then the average is taken. Many researchers consider essays as the most useful tool to assess learning outcomes, implying the ability to recall, organize and integrate ideas, the ability to supply merely than identify interpretation and application of data. Automated Writing Evaluation Systems, also known as Automated Essay Assessors, might provide precisely the platform we need to explicate many of the features those characterize good and bad writing and many of the linguistic, cognitive and other skills those underline the human capability for both reading and writing. They can also provide time-to-time feedback to the writers/students by using that the people can improve their writing skill. A meticulous research of last couple of years has helped us to understand the existing systems which are based on AI & Machine Learning techniques, NLP (Natural Language Processing) techniques and finding the loopholes and at the end to propose a system, which will work under Indian context, presently for English language influenced by local languages. Currently most of the essay grading systems is used for grading pure English essays or essays written in pure European languages. In India we have almost 21 recognized languages and influence of these local languages, in English, is very much here. Newspapers in Hyderabad sometimes print like – “Now the time has come to say ‘albida’ (good bye) to monsoon”. Due to the influence of local languages and English written by nonnative English speakers (ie. Indians) the result of TOEFL exams has shown lower scores against Indian students (also Asian students). This paper focuses on the existing automated essay grading systems, basic technologies behind them and proposes a new framework to over come the problems of influence of local Indian languages in English essays while correcting and by providing proper feedback to the writers.

Automated Essay Grading, AEG, Indian AEG, NLP, Text Processing, Essay Evaluation

1. INTRODUCTION

Evaluation and Grading considered playing a central role in the educational process. The interest in the development and in use of Computer-based Assessment Systems (CbAS) has grown exponentially in the last few years, due both to the increase of the number of students attending universities and to the possibilities provided by e-learning approaches to asynchronous and ubiquitous education. Presently more than forty commercial CbAS are currently available on the market. Most of those tools are based on the use of the so-called objective-type questions: i.e. multiple choice, multiple answer, short answer, selection/association, hot spot and visual identification. Most researchers in this field agree on the notion that some aspects of complex achievement are difficult to measure using objective-type questions. Learning outcomes implying the ability to recall, organize and integrate ideas, the ability to express oneself in writing and the ability to supply merely than identify interpretation and application of data, require less structuring of response than that imposed by objective test items (Gronlund, 1985). It is in the measurement of such outcomes, corresponding to the higher levels of the Bloom’s (1956) taxonomy (namely evaluation and synthesis) that the essay question serves its most useful purpose. One of the difficulties of grading essays is the subjectivity, or at least the perceived subjectivity, of the grading process. Many researchers claim that the subjective nature of essay assessment leads to variation in grades awarded by different human assessors, which is perceived by students as a great source of unfairness.

Furthermore essay grading is a time consuming activity. It is found that about 30% of teachers’ time is devoted to marking. A system for automated assessment would at least be consistent in the way it scores essays, and enormous cost and time savings could be achieved if the system can be shown to grade essays within the range of those awarded by human assessor. Furthermore using computers to increase our understanding of the textual features and cognitive skills involved in the creation and in the comprehension of written texts, provide a number of benefits to the educational community.

Purpose of this paper is to present a new concept over the existing ones, through which we can over come the problem of influence of local Indian languages in English essays. The system can do the grading of English essays as well as it can also provide sufficient feedback so that the students/user can understand what are the basic errors (spelling, grammar, sentence formation etc.) made by them and whether there essay is influenced by local language or not and how to overcome all these problems. The paper also discusses the current approaches to the automated assessment of essays (English Essays) and utilizes this as a foundation for the new framework. Thus, in the next section, research of some of the following important automated grading systems will be discussed: Project Essay Grade (PEG), Intelligent Essay Assessor (IEA), Educational Testing service 1, Electronic Essay Rater (ERater), C-Rater, BETSY, Intelligent Essay Marking System, SEAR, Paperless School free text Marking Engine and Automark. All these systems are currently available either as commercial systems or...
as the result of research in this field. In the later chapters the concept of the new system is described.

2. VARIOUS AUTOMATED ESSAY-GRADING SYSTEMS

Automated scoring capabilities are especially important in the realm of essay writing. Essay tests are a classic example of a constructed-response task where students are given a particular topic (also called a prompt) to write about. The essays are generally evaluated for their writing quality. Surprisingly for many, automated essay scoring (AES) has been a real and viable alternative and complement to human scoring for many years. As early as 1966, Page showed that an automated “rater” is indistinguishable from human raters (Page, 1966). In the 1990’s more systems were developed; the most prominent systems are the Intelligent Essay Assessor (Landauer, Foltz, & Laham, 1998), Intellimetric (Elliot, 2001), a new version of the Project Essay Grade (PEG, Page, 1994), and e-rater (Burstein et al., 1998).

Ellis Page set the stage for automated writing evaluation (see the timeline in Figure 1). Recognizing the heavy demand placed on teachers and large-scale testing programs in evaluating student essays, Page developed an automated essay-grading system called Project Essay Grader (PEG). He started with a set of student essays that teachers had already graded. He then experimented with a variety of automatically extractable textual features and applied multiple linear regressions to determine an optimal combination of weighted features that best predicted the teachers’ grades. His system could then score other essays using the same set of weighted features. In the 1960s, the kinds of features someone could automatically extract from text were limited to surface features. Some of the most predictive features Page found included average word length, essay length in words, number of commas, number of prepositions, and number of uncommon words—the latter being negatively correlated with essay scores.

In the early 1980s, the Writer’s Workbench tool (WWB) set took a first step toward this goal. WWB was not an essay-scoring system. Instead, it aimed to provide helpful feedback to writers about spelling, diction, and readability. In addition to its spelling program—one of the first spelling checkers - WWB included a diction program that automatically flagged commonly misused and pretentious words, such as irregardless and utilize. It also included programs for computing some standard readability measures based on word, syllable, and sentence counts, so in the process it flagged lengthy sentences as potentially problematic. Although WWB programs barely scratched the surface of text, they were a step in the right direction for the automated analysis of writing quality.

Figure 1. A timeline of research developments in writing evaluation

In February 1999, E-rater became fully operational within ETS’s Online Scoring Network for scoring GMAT essays. For low-stakes writing-evaluation applications, such as a Web-based practice essay system, a single reading by an automated system is often acceptable and economically preferable. The new version of e-rater (V.2) is different from other automated essay scoring systems in several important respects. The main innovations of e-rater V.2 are a small, intuitive, and meaningful set of features used for scoring; a single scoring model and standards can be used across all prompts of an assessment; modeling procedures that are transparent and flexible, and can be based entirely on expert judgment.
Figure 2. A common framework for the existing Automated Essay Grading Systems

Figure 2. shows a popular common frame work of the automated essay grading systems. Most of the modern systems train the system with all most thousands of pre-assessed essays (corpus). Then, once the essay input is given, it gives the grade and as well as a proper feedback to improve. Hence some of these systems can be used for self-learning by students as well as by the teachers or institutes for grading huge amount of essays. Today (from 2007) the internationally recognized TOEFL exam gives the grade to the students’ essays as a combination of human & machine assessment.

3. HOW THE AEG SYSTEMS WORK?

AEG systems are a combination of any two, three or all the techniques mentioned here - NLP (Natural Language Processing), Statistics, Artificial Intelligence (Machine Learning), Linguistics and Web Technologies, Text Categorization, annotated large corpora etc. It must be noted that seven out of ten most popular systems are based on the use of Natural Language Processing tools, which in some cases are complemented with statistical based approaches. How come it comes under Artificial Intelligence? The time, machine can grade human written essays, which requires some expertise, we can tell that this is Artificial Intelligence. As because, the commonly available systems cannot perform that task. Text categorization is the problem of assigning predefined categories to free text document. The idea of automated essay grading, based on text categorization techniques, text complexity features and linear regression methods was first explored by Larkey (1998). The underlying idea of this approach relies on training of binary classifiers to distinguish “good” from “bad” essays and on using the scores produced by the classifiers to rank essays and assign grades to them. Several standard text categorization techniques are used to fulfill this goal: first, independent Bayesian classifiers allow assigning probabilities to documents estimating the likelihood that they belong to specific classes; then, an analysis of the occurrence of certain words in the documents is carried out and a k-nearest neighbor technique is used to find those essays closest to a sample of human graded essays; finally, eleven text complexity features are used to assess the style of the essays. Larkey conducted a number of regression trials, using different combinations of components. She also used a number of essay sets, including essays on social studies, where content was the primary interest and essay on general opinion where style was the main criteria for assessment. A growing number of statistical learning methods have been applied to solve the problem of automated text categorization in the last few years, including regression models, nearest neighbor classifiers, Bayes belief networks, decision trees, rule learning algorithms, neural networks and inductive learning systems (Ying, 1997). This growing number of available methods is raising the need for cross method evaluation.
But the most relevant problem in the field of automated essay grading is the difficulty of obtaining a large corpus of essays (Christie, 2003; Larkey, 2003) each with its own grade on which experts agree. Such a collection, along with the definition of common performance evaluation criteria, could be used as a test bed for a standardized comparison of different automated grading systems. Moreover, these text sources can be used to apply to automated essay grading the machine learning algorithms well known in NLP research field, which consist of two steps: a training phase, in which the grading rules are acquired using various algorithms, and a testing phase, in which the rules gathered in the first step are used to determine the most probable grade for a particular essay. The weakness of these methods is the lack of a widely available collection of documents, because their performances are strongly affected by the size of the collection. A larger set of documents will enable the acquisition of a larger set of rules during the training phase, thus a higher accuracy in grading. A major part of these techniques, giving training to the systems and later stage, making the systems to learn from new essays or experience is nothing but machine learning.

The feature set used with some modern AEG systems include measures of grammar, usage, mechanics, style, organization, development, lexical complexity, and prompt-specific vocabulary usage. This feature set is based in part on the NLP foundation that provides the instructional feedback to students who are writing essays. In some cases a web-based service evaluates a student’s writing skill and provides instantaneous score reporting and diagnostic feedback. The score engine or score reporter (see figure 2.) provides score reporting. The diagnostic feedback is based on a suite of programs (writing analysis tools) that identify the essay’s discourse structure, recognize undesirable stylistic features, and evaluate and provide feedback on errors in grammar, usage, and mechanics. The writing analysis tools identify five main types of grammar, usage, and mechanics errors – agreement errors, verb formation errors, wrong word use, missing punctuation, and typographical errors. The approach to detecting violations of general English grammar is corpus based and statistical, and can be explained as follows. In case of corpus based systems the system is trained on a large corpus of edited text.

4. PROBLEMS WITH THE PRESENT SYSTEMS UNDER INDIAN CONTEXT

It has been found that most of the popular AEG systems are made to grade English essays and they are easy to follow. Systems developed in non-English languages are not popular and not understandable for everyone. Our research shows that while system grades an English essay it considers the influence of local languages as Error. Hence the following two sentences will show error once they are evaluated by machine as well as by a English spoken man. Ex 1 – Prime Minister Manmohan

Sing Garu has visited Osmania University. Ex 2 – Hyderabad says albida to monsoon. Where the ‘Garu’ is a pure Telugu word and used in English newspapers published form Andhra Pradesh. ‘Albida’ is an Urdu word and very much used in English newspapers coming out form Lucknow and Hyderabad. Local languages influence same as English used in Maharastra, Assma, Bengal or Tamilnadu of India and no one considers them as Error. Where as from English point of view they are wrong. Of course a good number of Hindi words got chance to be included in Oxford dictionary. Research shows present AEG systems illustrate 10 - 15% lower score while using Indian English text as Input. In a broader form it can be mentioned that the English spoken and written by non-native English people (i.e. - Asians) are very much influenced by local languages. India is a multilingual country with as many as 22 scheduled languages and only 5% (plz. read five percent!!) of the population is able to understand English and that’s also not like USA or UK people. Hence our goal is to develop a framework for an AEG system, which can be used for correcting essays written in Indian Languages, and also to teach how to write better English Essays. In this paper we propose a standard framework to develop any Automated Essay Grading System under Indian context. This model can be executed or s/w can be build as per the requirement as for example in which part of India the system is going to be used. Because while writing English the students of Andhra Pradesh are no influence by Bengali or Tamil, it is Telugu. Hence a single system will not be able to solve the problem. But this framework can be used as a benchmark to develop the other AEG systems under Indian context. The framework follows IEEE Std. 1471 –2000, which is about “IEEE Recommended Practice for Architectural Description of Software Intensive Systems”.

5. PROPOSED FRAMEWORK

Under the above circumstances a need of a specialized AEG system was felt very much. Hence a new framework is proposed, which is the core part of this paper, where the system will have the capability of identifying the local languages (Indian) present in the submitted essay and it will also find out how much effect is there for these words. It will also help the students to resubmit the essay with corrections where the students will be asked to re-enter the similar words for those local languages. Their essays will be graded as it is they have entered the equivalent English words by their own. For the instructors or teachers it will also give a proper score-card mentioning that still how much the essay is influenced by the local languages and the no of local words present, number of times corrections made by students (i.e. they can be given two or three chances to enter equivalent English words for those local words (i.e. albida = good bye). This above-mentioned action is a part of the scoring engine. These functionalities are added as a new functional module in the scoring engine or score reporter.
The feedback module is also supported with a ‘local language’ engine which helps the students providing proper feedback and development notes along with English Grammatical mistakes improvement, feedback on use of too many weak or common words etc. This engine will be very much useful in the learning stage. At the very beginning this engine will identify the local languages present in the written essay. Then it will give a chance to the students to overcome this problem by providing equivalent English words by their own. Then it will show them the projected score with number of general (English) errors and presence of number of local languages and what are those. For the remaining local words in the essay the system will then suggest equivalent English words with similar English words of those. Now the students get a chance to substitute remaining local words, phrases with suggested English words. After submission they get the final projected score. Hence these engines help the students to learn better English. To make these engines effective the system is trained with a good number of local words, which are very much used in normal English (spoken English, newspaper English). To make a proper collection of local words used in the news papers like Deccan Chronicle, Hindu (AP edition), Times of India (AP edition) etc., collected over last couple of years. It is found that this specific region’s English is influenced by Telugu and Hyderabadi Hindi (a good mixing of Hindi and Urdu).

6. CONCLUSION

In his paper ‘Region Effects in AEG & human discrepancies of TOEFL score’ Attali (2005) mentioned Asian Students show higher organization scores and poor grammar, usage and mechanics scores compare to other students. More over local languages influence them. Serious work in the area of AEG can bring significant changes in this direction and also can give a new shape to Indian NLP & Machine Learning research work.

Future plans - In near future the following things will be taken into consideration so that some solutions can be given as - Solution for machine translated essays (how to recognize them?), Capturing the mental status of the student writing essay (psychometric models will be considered). Detection of Anomalous Essays.
