A Database Management System (DBMS) is a set of computer programs that controls the creation, maintenance, and the use of the database of an organization and its end users. It allows organizations to place control of organization-wide database development in the hands of database administrators (DBAs) and other specialists. DBMSs may use any of a variety of database models, such as the network model or relational model. We have focused mainly on Query Tuning in Query Processing and database implementation in Agroforestry.
