Abstract

Smart metes used in electric grids need a dedicated network that should be highly reliable &
cost effective. Various techniques like 3G cellular have been proposed to improve efficiency of
this smart grid electric meter network. For distribution of proper information in smart grid
system Hybrid Spread Spectrum using slow frequency technology is also better choice. To
improve the performance of this network in the terms of throughput and number of smart meter
per data aggregation point (DAP), we have proposed HSS-FFH (to implement AMI) method.
These techniques give better result in terms of coverage high density population area &
interference immunity.
