Abstract

Mining is way of providing and extracting some meaning information from the data so that the
data can be classified and grouped easily and quickly. These mining algorithms can be applied
in various fields including classification of agricultural crops production. In the fields of Data
Mining various efficient algorithms are implemented for the classification of agricultural crops
production. Here in this paper a survey of all the existing techniques as well as their advantages
and issues are discussed. Hence by analyzing their various advantages and issues a new and
efficient technique for the classification of agricultural crops production is proposed in future
such as classification using Fuzzy Conclusion Tree by the Optimizing the Feature Withdrawal
using PSO-SVM (Particle Swarm Optimization with Support Vector Machine).
