Abstract

This paper presents how the different users' Internet usage in urban–rural areas with e-commerce, and e-banking and these activities in remote areas, information technology might serve as a substitute for urban collection. We survey the technology comparison between the rural and urban areas, and we found the rural area users are not more aware but in urban area users are more aware and efficient use the technologies e-system so we are required the e-education in rural areas. The outcomes results show in form of percentage of internet uses for village and district level and this result is efficient and accurate. These result calculated by numerical computational software MATLAB 7.14.
