Abstract

This paper presents how the different users' Internet usage in urban–rural areas with e-commerce and e-banking and these activities in remote areas, information technology might serve as a substitute for urban collection. We survey the technology comparison between the rural and urban area, where we found the rural area users are not more aware but in urban area users are more aware and efficient use the technologies e-system so we are required the e-education in rural area. The outcomes results show in form of percentage of internet uses for village and district level and these results are efficient and accurate. These results calculated by numerical computational software MATLAB 7.14.
