## ABSTRACT

Based on some result given in [2], concerning the termination of a **semi-Thue system**, we give some results illustrated by some examples to give some Noetherian **semi-Thue systems**.

## Keywords

Free monoid, morphism of monoids, closure of a binary relation, rewriting systems of words, well-founded (Noetherian), weight function.

## 1. INTRODUCTION

The central idea of rewriting is to impose directionality on the use of equations in proofs. A **semi-Thue system** is a pair  $(A, R)$  where  $A$  is an alphabet and  $R$  is a non-empty finite binary relation on  $A^*$ . We write  $usv \rightarrow_R utv$  whenever  $u, v \in A^*$  and  $(s, t) \in R$ . We write  $u \xrightarrow_R^* v$  if there words  $u_0, u_1, \dots, u_n \in A^*$  such that:

$$u_0 = u, u_i \rightarrow_R u_{i+1}, \forall 0 \leq i \leq n-1 \text{ and } u_n = v.$$

If  $n = 0$ , then  $u = v$ , and if  $n = 1$ , we have  $u \rightarrow_R v$ .

$\xrightarrow_R^*$  is the reflexive transitive closure of  $\rightarrow_R$ .

The **semi-Thue system**  $(A, R)$  is terminating if there does not exist an infinite chain  $u_1 \rightarrow_R u_2 \rightarrow_R u_3 \rightarrow_R \dots$  in  $A^*$ .

Define the accessibility problem as follow: given a **semi-Thue system**  $(A, R)$  and two words  $u$  and  $v$  over the alphabet of  $A$ , decide whether  $u \xrightarrow_R^* v$ .

The remainder of this paper is organized as follows. The Section 2, is devoted to the preliminaries notions. In Section 3, we give some results concerning the termination problem for a rewriting system. Finally, we draw our conclusions in Section 4.

## 2. PRELIMINARIES

Let  $A$  be a set, which we call an alphabet. A word  $w$  on the alphabet  $A$  is a finite sequence of elements of  $A$

$$u = (a_1, a_2, \dots, a_n) \quad a_i \in A.$$

The set of all words on the alphabet  $A$  is denoted by  $A^*$  and is equipped with the associative operation defined by the concatenation of two sequences

$$(a_1, a_2, \dots, a_n)(b_1, b_2, \dots, b_m) = (a_1, a_2, \dots, a_n, b_1, b_2, \dots, b_m)$$

This operation is associative. This allows us to write

$u = a_1 a_2 \dots a_n$ . The string consisting of zero letters is called the empty word, written  $\varepsilon$ . Thus,  $\varepsilon, 0, 1, 011, 1111$  are words over the alphabet  $\{0, 1\}$ . The set  $A^*$  of words is equipped with the structure of a monoid. The monoid  $A^*$  is called the free monoid on  $A$ . The length of a word  $u$ , denoted  $|u|$ , is the number of letters in  $u$  where each letter is counted as many times as it occurs. Again by definition,  $|\varepsilon| = 0$ . The length function possesses some of the formal properties of logarithm:

$|uv| = |u| + |v|, |u^i| = i|u|$ , for any words  $u$  and  $v$  and integers  $i \geq 0$ . For example  $|011| = 3$  and  $|1111| = 4$ . For a subset  $B$  of  $A$ , we let  $|u|_B$  denote the number of letters of  $u$  which are in  $B$ . Thus  $|u| = \sum_{a \in A} |u|_a$ . A language  $L$  over  $A^*$  is any subset of  $A^*, i, e, L \subseteq A^*$ .

A mapping  $h: A^* \rightarrow \Delta^*$ , where  $A$  and  $\Delta$  are alphabets, satisfying the condition

$$h(uv) = h(u)h(v), \text{ for all words } u \text{ and } v \text{ of } A^*$$

is called a morphism. It is noted here, to define an alphabetic morphism  $h$ , it suffices to list all the words  $h(a)$ , where  $a \in A$ . If  $M$  is a monoid, then any mapping  $f: A \rightarrow M$  can be extended to a unique morphism

$\hat{f}: A^* \rightarrow M$  For instance, if  $M$  is the additive monoid  $\mathbb{N}$ , and  $f$  is defined by  $f(a) = 1$  for each  $a \in A$ , then  $\hat{f}(u)$  is the length  $|u|$  of the word  $u$ .

Let  $h: A^* \rightarrow \Delta^*$  be a morphism of monoids. if  $h$  is one-to-one and onto, then  $h$  is an isomorphism and the monoids  $A^*$  and  $\Delta^*$  are isomorphic. we denote by  $\text{Hom}(A^*, \Delta^*)$  the set of morphisms from  $A^*$  to  $\Delta^*$  and  $\text{Isom}(A^*, \Delta^*)$  the set of all isomorphism's from  $A^*$  to  $\Delta^*$ .

A binary relation on  $X$  is a subset  $R \subseteq X \times X$ . If  $(x, y) \in R$ , then we denote  $xRy$  and we say that  $x$  is related to  $y$  by  $R$ . The inverse relation of  $R$  is the binary relation

$$R^{-1} \subseteq X \times X. \text{ Defined by: } yR^{-1}x \Leftrightarrow (x, y) \in R.$$

The relation  $I_X = \{(x, x), x \in X\}$  is called the identity relation. The relation  $(X)^2$  is called the complete relation.

Let  $R \subseteq X \times X$  and  $S \subseteq X \times X$  two a binary relations, the composition of  $R$  and  $S$  is a binary relation  $S \circ R \subseteq X \times X$  defined by  $xS \circ Rz \Leftrightarrow \exists y \in X$  such that  $xRy$  and  $ySz$ .

A binary relation  $R$  on a set  $X$  is said to be

1. Reflexive if  $xRx$  for all  $x$  in  $X$ ;
2. Symmetric if  $xRy$  implies  $yRx$ ;
3. Transitive if  $xRy$  and  $yRz$  imply  $xRz$ .
4. Ant symmetry if  $xRy$  and  $yRx$  imply  $x = y$ .

A binary relation  $\geq$  on a set  $X$  is **partial order** (or partial ordering) iff it is reflexive, transitive and ant symmetric.

A **strict partial ordering**  $>$  on a set  $X$  is irreflexive, ant symmetric and transitive relation on  $X$ .

A **strict partial ordering**  $>$  is called **well-founded (Noetherian)**, if there is no infinite descending chain  $x_0 > x_1 > x_2 \dots$

Let  $(X, >)$  be a **well-founded ordering**, let  $P$  be property of elements of  $X$ , if for all  $x \in X$  the implication:

If  $P(x')$ , for all  $x' \in X$  such that  $x > x'$  then  $P(x)$ .

Let  $R$  be a relation on a set  $X$ . The reflexive closure of  $R$  is the smallest reflexive relation  $R^0$  on  $X$  that contains  $R$ ; that is,

1.  $R \subseteq R^0$
2. if  $R'$  is a reflexive relation on  $X$  and  $R \subseteq R'$ , then  $R^0 \subseteq R'$ .

The symmetric closure of  $R$  is the smallest symmetric relation  $R^+$  on  $X$  that contains  $R$ ; that is,

3.  $R \subseteq R^+$
4. if  $R'$  is a symmetric relation on  $X$  and  $R \subseteq R'$ , then  $R^+ \subseteq R'$ .

The transitive closure of  $R$  is the smallest transitive relation  $R^*$  on  $X$  that contains  $R$ ; that is,

1.  $R \subseteq R^*$ ,
2. if  $R'$  is a transitive relation on  $A^*$  and  $R \subseteq R'$ , then  $R^* \subseteq R'$ .

Let  $R$  be a relation on a set  $X$ . Then

1.  $R^0 = R \cup I_X$ .
2.  $R^+ = R \cup R^{-1}$ .
3.  $R^* = \bigcup_{k=1}^{k=\infty} R^k$ .

A **semi-Thue system**  $R$  over  $A$ , for briefly STS, is a finite set  $R \subseteq A^* \times A^*$ , whose elements are called rules. A rule  $(s, t)$  will also be written as  $s \rightarrow t$ . The set  $dom(R)$  of all left-hand sides and  $ran(R)$  of all right-hand sides are defined by:

$$dom(R) = \{s \in A^*, \exists t \in A^*: (s, t) \in R\} \text{ and}$$

$$ran(R) = \{t \in A^*, \exists s \in A^*: (s, t) \in R\}.$$

If  $R$  is finite, then the size of  $R$  is defined to be  $\sum_{(s,t) \in R} (|s| + |t|)$  and is denoted by  $\|R\|$ .

We define the binary relation  $\rightarrow_R$  as follows, where  $u, v \in A^*$ :  $u \rightarrow_R v$  if there exist  $x, y \in A^*$  and  $(r, s) \in R$  with  $u = xry$  and  $v = xsy$ . We write  $u \xrightarrow_R^* v$  if there words

$u_0, u_1, \dots, u_n \in A^*$  such that:

$$u_0 = u, u_i \rightarrow_R u_{i+1}, \forall 0 \leq i \leq n-1 \text{ and } u_n = v.$$

If  $n = 0$ , then  $u = v$ , and if  $n = 1$ , we have  $u \rightarrow_R v$ .

Note that  $\xrightarrow_R^*$  is the reflexive transitive closure of  $\rightarrow_R$ .

The set of irreducible words with respect to  $R$  is

$$IRR(R) = A^* - \{xsy: x, y \in A^*, s \in dom(R)\}.$$

We say that  $R$  is Noetherian if there does not exist an infinite sequence of words  $u_i \in A^* (i \in \mathbb{N})$  such that  $u_0 \rightarrow_R u_1 \rightarrow_R \dots$

Let  $>$  be a binary relation on  $A^*$ . The relation  $>$  is **admissible**, if for all  $u, v, x, y \in A^*$ ,

$$u > v \text{ implies } xuy > xvy.$$

Let  $A = \{a_1, a_2, \dots, a_n\}$ , with  $a_n > a_{n-1} > \dots > a_1$ , in the following cases, we give some of **admissible partial orderings** on  $A^*$ .

1. Define  $x > y$  as follows:  $x > y$  if  $|x| > |y|$  is the **length ordering** on  $A^*$ .
2. Let  $w: A \rightarrow \mathbb{N}$  be a mapping that associates a positive integer (a **weight**) with each letter. Define

the **weight ordering**  $>_w$  induced by  $w$  as follows:  
 $x >_w y$  if  $w(x) > w(y)$ .

Here  $w$  is extended to a mapping from  $A^*$  into  $\mathbb{N}$  by taking  $w(\varepsilon) = 0$  and  $w(xa) = w(x) + w(a)$  for all  $x \in A^*, a \in A$ .

3. The **lexicographical ordering**  $>_{lex}$  on  $A^*$  is defined as follows:  $x >_{lex} y$  if there is a non-empty string  $z$  such that

$$x = yz, \text{ or } x = ua_i v \text{ and } y = ua_j z,$$

For some  $x, v, z \in A^*$  and  $i, j \in \{1, \dots, n\}$  satisfying  $i > j$ .

4. The **length-lexicographical ordering**  $>_{ll}$  is a combination of the **length ordering** and **lexicographical ordering**:  $x >_{ll} y$  if  $|x| > |y|$  or  $|x| = |y|$  and  $x >_{lex} y$ .

### 3. STUDY OF CASES WHERE THE WORD REWRITING SYSTEM IS NOETHERIAN

In this section, we use the following theorem from [2], to giving some results concerning a Noetherian **semi-Thue system**.

#### Theorem 3.1 [2]

Let  $(A, R)$  be a **semi-Thue system**. Then the following two statements are equivalent:

1. The reduction relation  $\rightarrow_R$  is Noetherian.
2. There exists an **admissible well-founded partial ordering**  $>$  on  $A^*$  such that  $x > y$  holds for each  $(s, t) \in R$ .

#### Corollary 3.2

Let  $(A, R)$  be a **semi-Thue system**, with

$$R = \{(a_i, b_i), 0 \leq i \leq n, n \in \mathbb{N}\}, \text{ if } \forall 0 \leq i \leq n, |a_i| > |b_i|,$$

then  $(A, R)$  is Noetherian.

#### Proof

To obtain the desired result, we show that there exists an **admissible well-founded partial ordering**  $>$  on  $A^*$  such that  $x > y$  holds for each  $(s, t) \in R$ . It suffices to take the **length ordering**  $>$  defined by  $x > y$  if  $|x| > |y|$ .

#### Example 3.3

Consider the **semi-Thue system**  $(A, R)$  with  $A = \{a, b\}$  and  $R = \{(aa, b)\}$ . We have  $|aa|=2, |b|=1$ , then  $|aa| > |b|$ , consequently  $(A, R)$  is Noetherian.

#### Corollary 3.4

Let  $(A, R)$  be a **semi-Thue system**, with

$$A = \{a_0, a_1, \dots, a_n\} \text{ and}$$

$$R = \{(a_j, b_j), 0 \leq j \leq m, m \in \mathbb{N}\}.$$

Consider the mapping  $w: A \rightarrow \mathbb{N}, a_i \mapsto w(a_i)$  and

$$w: A^* \rightarrow \mathbb{N}, w(x) = \sum_{i=0}^{i=n} w(a_i) |x|_{a_i}.$$

If for all  $j \in \{0, \dots, m\}: w(a_j) > w(b_j)$  then

$(A, R)$  is Noetherian.

**Proof**

To obtain the desired result, we show that there exists an **admissible well-founded partial ordering**  $>$  on  $A^*$  such that  $x > y$  holds for each  $(s, t) \in R$ . It suffices to take the **weight ordering**  $>_w$  induced by  $w$  as follows:

$$x >_w y \text{ if } \sum_{i=0}^{i=n} w(a_i)|x|_{a_i} > \sum_{i=0}^{i=n} w(a_i)|y|_{a_i} .$$

**Example 3.5**

Let  $A = \{a, b, c\}$ ,  $R = \{(bb, aa), (cb, ab)\}$  and

$w: \{a, b, c\} \rightarrow \mathbb{N}$ , with  $w(a) = 1, w(b) = 2, w(c) = 3$ .

We check that  $w(bb) > w(aa)$  and  $w(cb) > w(ab)$ .

$$\begin{aligned} \text{We have } w(bb) &= w(a)|bb|_a + w(b)|bb|_b + w(c)|bb|_c \\ &= 1 \times 0 + 2 \times 2 + 3 \times 0 = 4. \end{aligned}$$

A similar argument we have

$$\begin{aligned} w(aa) &= w(a)|aa|_a + w(b)|aa|_b + w(c)|aa|_c \\ &= 1 \times 2 + 2 \times 0 + 3 \times 0 = 2. \end{aligned}$$

On the other hand we have,

$$\begin{aligned} w(cb) &= w(a)|cb|_a + w(b)|cb|_b + w(c)|cb|_c \\ &= 1 \times 0 + 2 \times 1 + 3 \times 1 = 5. \end{aligned}$$

And  $w(ab) = w(a)|ab|_a + w(b)|ab|_b + w(c)|ab|_c$

$$= 1 \times 1 + 2 \times 1 + 3 \times 0 = 3.$$

Finally  $(A, R)$  is Noetherian.

**Corollary 3.6**

Let  $A = \{a_1, a_2, \dots, a_n\}$ , with  $a_n > a_{n-1} > \dots > a_1$ . Let  $(A, R)$  be a **semi-Thue system**.

If for all  $(s, t) \in R, s >_{lex} t$ , then  $(A, R)$  is Noetherian.

**Proof**

To obtain the desired result, we show that there exists an **admissible well-founded partial ordering**  $>$  on  $A^*$  such that  $x > y$  holds for each  $(s, t) \in R$ . It suffices to take the **lexicographical ordering**  $>_{lex}$ .

**Example 3.7**

Let  $A = \{a, b, c\}$ , with  $c > b > a$ .  
 $R = \{(ba, ab), (cb, bc)\}$ . We have  $ba >_{lex} ab$  and  $cb >_{lex} bc$ . Then  $(A, R)$  is Noetherian.

**Corollary 3.8**

Let  $(A, R)$  be a **semi-Thue system**. Consider the morphism of monoids  $f: (A^*, \cdot) \rightarrow (\mathbb{N}, +)$ .

If for all  $(s, t) \in R, f(s) > f(t)$ , then  $(A, R)$  is Noetherian.

**Proof**

To obtain the desired result, we show that there exists an **admissible well-founded partial ordering**  $>$  on  $A^*$  such that  $x > y$  holds for each  $(s, t) \in R$ . It suffices to take the **weight ordering**  $>_f$  induced by  $f$  as follows:

$$x >_f y \text{ if } f(x) > f(y).$$

**Example 3.9**

Let  $A = \{a, b, c\}$ ,  $R = \{(ba, bc), (ab, ac)\}$ .

Consider the morphism of monoids  $f: (A^*, \cdot) \rightarrow (\mathbb{N}, +)$ , with  $f(a) = 2, f(b) = 1, f(c) = 0$ . We check that  $f(ba) > f(bc)$  and  $f(ab) > f(ac)$ .

We have  $f(ba) = 3, f(bc) = 1$  and  $f(ab) = 3$ ,

$f(ac) = 2$ . Finally  $(A, R)$  is Noetherian.

**4. CONCLUSION**

In this paper, we have given an **admissible well-founded partial ordering**  $>$  on the free monoid  $A^*$  with a finite alphabet  $A$ , in order to assure that the **semi-Thue system** is Noetherian.
