ABSTRACT
An efficient method for power quality disturbances recognition and classification is presented in this paper. The method used is based on the Kalman filter and fuzzy expert system. Various classes of disturbances are generated using Matlab parametric equations. Kalman filter is used for extracting the input features of various power disturbances. The extracted features such as amplitude and slope are applied as inputs to the fuzzy expert system that uses some rules on these inputs to classify the PQ disturbances. Fuzzy classifier has been implemented and tested for various types of power quality disturbances. The results clearly indicate that the proposed method has the ability to detect and classify PQ disturbances accurately. The performance of the proposed method has been evaluated by comparing the results against Kalman filter based neural classifier.

Keywords
Power quality, Power quality events, Kalman Filter, Fuzzy logic, Fuzzy-expert system.

Nomenclature
$X_{a,b}$ - Continuous wavelet transform  
a & b - Dilation and translation parameter  
$\Psi(t)$ - Mother wavelet  
x$_k$ - State vector  
y$_k$ - Voltage sinusoid  
z$_k$ - Measurement at the time instant $t_k$  
$\Phi_k$ - State transition matrix  
$H_k$ - Measurement matrix  
w$_k$ & $v_k$ - Model and measurement errors  
$\omega$ - Fundamental angular frequency  
$A_{i,k}$ & $\theta_k$ - Amplitude and phase angle of the $i^{th}$ harmonic at time $t_k$  
$\Delta$ - Sampling interval  
$R_k$ - Covariance matrix of $v_k$  
$K_k$ - Kalman gain  
$P_k^-$ - Prior process covariance  
$Q_k$ - Covariance matrix of $w_k$  
$P_k$ - Error covariance

1. INTRODUCTION
In the recent years, power quality related problems have become an important issue for both utilities and customers. Reasons for the poor quality of electric power are power line disturbances such as sag, swell, interruption, harmonics, etc. In order to improve the electric power quality, the sources and occurrences of such disturbances must be detected and the events are to be classified. The various types of power quality disturbances were detected and localized based on wavelet transform analysis as illustrated in [1]. Time and frequency of multi resolution wavelets have been presented in [2] to analyze and classify the electromagnetic power system transients.

Another approach based on wavelets to identify the various power system transient signals such as capacitor switching, lighting impulse, etc has been discussed in [3]. The data processing burden of the classification algorithm has been considerably reduced by compressing the signals through wavelet transform methods as illustrated in [4]. An adaptive neural network based power quality analyzer for the estimation of electric power quality has been applied and the disturbances were classified in [5].

Classification of power quality events using a combination of SVM and RBF networks has been presented in [6]. The short time Fourier transforms (STFT) based power frequency harmonic analyzer has been discussed in [7] for the non stationary signals. The Fourier and wavelet transform based fuzzy expert system for the detection and classification of PQ disturbances has been demonstrated in [8].

Wavelet multi-resolution technique along with neuro-fuzzy classifier for PQ disturbance detection has been explained [9]. As wavelet transforms cannot be applied for the analysis of non stationary signals, S-transforms were implemented due to their excellent frequency resolution characteristics. Application of s-transform for power quality analysis has been discussed in [10] and a fuzzy logic based pattern recognition system along with multi resolution S-transform for power quality event classification has been discussed in [11].

The classification of the power quality disturbances in both single and multiple natures using S-transform and Pattern recognition techniques has been implemented in [12]. A combination of wavelet transform along with both ANN and fuzzy logic classifier has been implemented for the PQ events classification in [13]. Artificial neural network (ANN) based real time electric power quality disturbance classification has been illustrated in [14]. Support vector machine (SVM) based electrical voltage disturbance classification has been illustrated in [15]. A hybrid method for the real time frequency estimation based on Taylor series and discrete Fourier algorithm has been illustrated in [16].
Classification of power quality disturbances using the combined form of Hilbert Huang transform (HHT) and Relevance vector machine (RVM) has been presented in [17]. Dual neural network namely ADALINE and FFNN have been implemented for the classification of single and combined form power quality disturbance in [18]. Classification of both the single and combined nature of power quality disturbances using signal sparse decomposition (SSD) has been illustrated in [19]. A Kalman filter and fuzzy expert system based power quality analyzer in which features are extracted using Kalman Filter and disturbances are classified using an fuzzy expert system is presented in this paper.

2. PROPOSED METHOD

The proposed method has two stages namely

i. Feature extraction stage
ii. Classification stage.

In the feature extraction stage, Kalman Filter is used for extracting features such as standard deviation and variances. The classification stage consists of the Fuzzy expert system. Disturbance waveforms were generated using Matlab parametric equations.

2.1 Feature Extraction Stage

2.1.1 Wavelet Transform

Wavelet transform is highly useful tool in signal analysis. The continuous wavelet transform of a signal \( x(t) \) is defined as

\[
\tilde{x}_{a,b} = \frac{1}{\sqrt{|a|}} \int_{-\infty}^{\infty} x(t) \psi\left(\frac{t-b}{a}\right)dt
\]

\[
\psi_{a,b}(t) = \frac{1}{\sqrt{|a|}} \psi\left(\frac{t-b}{a}\right)
\]

The Discrete Wavelet Transform (DWT) calculations are usually carried out for a chosen subset of scales and positions. This is usually done by using filters for computing approximations and details. The approximations are the high-scale, low frequency components of the signal and details are the low-scale, high-frequency components.

The DWT coefficients are computed using the equation:

\[
X_{a,b} = \tilde{x}_{a,b}= \sum_{n \in \mathbb{Z}} x[n] g_{j,k}[n]
\]

Where \( a = 2j, b = k2j, j \in \mathbb{N}, k \in \mathbb{N}. \)

The wavelet filter \( g \) acts as mother wavelet \( \psi \) and the covariance of the details is considered as an initial input to the Kalman filter.

2.1.2 Kalman Filter

As Kalman filter has been identified as an optimal estimator with minimum error covariance it has been used here for the purpose of feature extraction. Kalman filter is characterized by a set of dynamic state equations and measurement equations, given a set of observed data, as illustrated below.

\[
X_{k+1} = \Phi X_k + w_k
\]

\[
x_k = H_k x_k + v_k
\]

In order to obtain a satisfactory performance of Kalman filter, it is necessary to know both the dynamic process and the measurement model. In the power system, the measured signal can be expressed by a sum of sinusoidal waveforms and the noise. Let an observed signal \( x_k \) at time \( t_k \) be the sum of \( y_k \)

and \( v_k \), which represents \( M \) sinusoids and the additive noise for sampling points. Then

\[
z_k = y_k + v_k
\]

\[
z_k = \sum_{i=1}^{n} A_{ik} \sin\left(\omega_{ik} \Delta T + \theta_{ik}\right) + v_k
\]

Where \( k = 1, 2, 3, \ldots, N \).

Each frequency component requires two state variables and hence the total number of state variables is \( 2n \). At any time \( k \), these state variables are defined as

For \( 1_{st} \) harmonics: \( x_1 = A_1 \cos (\theta_1) \) \( x_1 = A_1 \sin (\theta_1) \)

For \( 2_{nd} \) harmonics: \( x_2 = A_2 \cos (\theta_2) \) \( x_2 = A_2 \sin (\theta_2) \)

For \( n_{th} \) harmonics: \( x_{2n-1} = A_n \cos (\theta_n) \) \( x_{2n-1} = A_n \sin (\theta_n) \)

The above set of equations can be written in matrix form as,

\[
X_{k+1} = \begin{bmatrix} X_1 \\ X_2 \\ \vdots \\ X_{2n} \\ j+1 \end{bmatrix} = \begin{bmatrix} 1 & 0 & \ldots & 0 \\ 0 & 1 & \ldots & 0 \\ \vdots & \vdots & \ddots & \vdots \\ 0 & 0 & \ldots & 1 \end{bmatrix} + w_k
\]

\[
x_k = H_k x_k + v_k = \begin{bmatrix} \sin (\omega_{k1} \Delta T) \\ \cos (\omega_{k1} \Delta T) \\ \vdots \\ \cos (\omega_{kn} \Delta T) \end{bmatrix} \begin{bmatrix} X_1 \\ X_2 \\ \vdots \\ X_{2n} \end{bmatrix}_{k-1} + v_k
\]

The system covariance matrices for \( w_k \) and \( v_k \) can be written as

\[
E[w_k w_k^T] = [R_k] \quad \text{and} \quad E[v_k v_k^T] = [Q_k]
\]

The Kalman Filter execution procedure is a recursive one, with steps for time and measurement updates as listed as below.

Time update

1) Project the state ahead

\[
X_{k+1}^\wedge = \Phi X_k
\]

2) Project the error covariance ahead

\[
P_{k+1}^\wedge = \Phi P_k \Phi^T + R_k
\]

Measurement update

1) Compute the Kalman gain

\[
K_k = P_k H_k^T (H_k P_k H_k^T + R_k)^{-1}
\]
2) Update estimate with measurement
\[ x_k = x_{k-1} + K_k (z_k - H_k) x_{k-1} \]

3) Update the error covariance
\[ P_k = (I - K_k H_k) P_{k-1} \]

Time and measurement update equation (11) & (12) are alternatively solved. After each time and measurement update pair, the process is repeated using the previous posterior estimates to project the new a prior estimates. At any given instant k, the amplitudes of the fundamental and harmonic frequencies are computed from estimated variables as
\[ A_{i,k} = \sqrt{X_{i,k}^2 + X_{i,k}^2} \]
\[ A_{i,k} = \sqrt{\sum_{i=1}^{n} X_{i,k}^2} \]
\[ \text{Slope of the signals, } \text{Slope}_k = (A_{i,k} - A_{i,k-1})/\Delta T \]

### 2.1.3 Fuzzy Expert System

Fuzzy system provides a simple way to get definite conclusion based upon ambiguous. The accuracy of the fuzzy logic system depends on the knowledge of human experts. The mamdani type of fuzzy inference system used to perform the classification of the PQ events. It has two inputs, one output with 25 rules.

The brief rule sets of fuzzy expert system are shown below:

1. If (Amplitude is VA) and (Slope is VSS) then (output is INTERRUPTION).
2. If (Amplitude is VA) and (Slope is SS) then (output is INTERRUPTION).
3. If (Amplitude is VA) and (Slope is VS) then (output is INTERRUPTION).
4. If (Amplitude is VA) and (Slope is VLA) then (output is INTERRUPTION).
5. If (Amplitude is VA) and (Slope is VLA) then (output is INTERRUPTION).
6. If (Amplitude is VA) and (Slope is VLA) then (output is INTERRUPTION).
7. If (Amplitude is VA) and (Slope is VLA) then (output is INTERRUPTION).
8. If (Amplitude is VA) and (Slope is VLA) then (output is INTERRUPTION).
9. If (Amplitude is VA) and (Slope is VLA) then (output is INTERRUPTION).
10. If (Amplitude is VA) and (Slope is VLA) then (output is INTERRUPTION).
11. If (Amplitude is NA) and (Slope is VS) then (output is INTERRUPTION).
12. If (Amplitude is NA) and (Slope is SS) then (output is SAG).
13. If (Amplitude is NA) and (Slope is NS) then (output is NORMAL).
14. If (Amplitude is NA) and (Slope is VSS) then (output is HARMONICS).
15. If (Amplitude is NA) and (Slope is VLA) then (output is SWELL).
16. If (Amplitude is NA) and (Slope is VSS) then (output is SAG).
17. If (Amplitude is NA) and (Slope is VLA) then (output is NORMAL).
18. If (Amplitude is NA) and (Slope is VSS) then (output is SWELL).
19. If (Amplitude is NA) and (Slope is VLA) then (output is SWELL WITH HARMONICS).
20. If (Amplitude is NA) and (Slope is VSS) then (output is SWELL WITH HARMONICS).
21. If (Amplitude is VLA) and (Slope is VSS) then (output is NORMAL).
22. If (Amplitude is VLA) and (Slope is SS) then (output is SWELL).
23. If (Amplitude is VLA) and (Slope is SS) then (output is SAG).
24. If (Amplitude is VLA) and (Slope is VSS) then (output is NOTCH).
25. If (Amplitude is VLA) and (Slope is VSS) then (output is NOTCH).

### 3. CLASSIFICATION STAGE

In this stage, features extracted through the Kalman filter are applied as inputs to the fuzzy expert system in order to classify the various power quality disturbances. Fuzzy logic with the rule based expert system has emerged the classification tool for PQ events. The rules of this technique are based on modeling human experience and expertise.

#### 3.1 Flowchart of the Proposed Method

The flowchart for the Classification of Power Quality disturbances is shown below.

It has three different blocks.

- Block-(a) – Extraction of features
- Block-(b) – Detection and classification of the disturbances
Figure 1. Fuzzy expert system

Figure 2. Output membership function

Figure 3. Rule viewer of fuzzy expert system
4. Simulation and Test Results
Training and Test data were generated using a set of parametric equations for various classes of disturbances and this method of data generation offers the advantages such as a wide range of parameters can be generated in a controlled manner, signals closer to real situation can be simulated and different signals belonging to same class can be generated with ease so that the generalization ability of fuzzy based classifier could be improved. Nine classes (S1–S9) of different PQ disturbances, namely pure sine (normal), sag, swell, outage, harmonics, sag with harmonic, swell with harmonic, notch and flicker were considered.

These input signals are applied to the fuzzy expert system to get accurate classification of disturbances. The PQ disturbance signals generated using the Matlab based parametric equations. The following case studies are presented to highlight the suitability of the application of the proposed method. The following case studies are presented to highlight the suitability of the application of the proposed method.

1) Pure sine wave
It is a voltage signal of amplitude 1 V at 50 Hz and its waveform is as shown in the figure 5(a). The amplitude and the slope outputs of the signal are shown in the figures 5(b) and 5(c).

![Figure 5(a)](image1)

![Figure 5(b)](image2)
2) Voltage sag
The voltage sag (or) voltage dips cause the decrease of system voltage. The duration of the sag disturbance is 0.2 to 0.4 cycles in 1 min. The voltage dip waveform is shown in the figure 6(a). The amplitude and slope outputs of the sag disturbance signal are shown in the figures 6(b) and 6(c).

3) Voltage swell
Voltage swell causes the rise of system voltage. The duration of the swell disturbance is 0.2 to 0.4 cycles in 1 min. The voltage swell waveform is shown in the figure 7(a). The amplitude and slope outputs of the sag disturbance signal are shown in the fig 7(b) & 7(c).

5) Harmonics
Harmonics are generated by the connection of non linear load to the system. The distortion of the voltage waveform is shown in the figure 9(a). The amplitude and slope outputs of the original distortion waveforms are shown in the figures 9(b) and 9(c).

6) Sag with Harmonics
This disturbance type is caused by the presence of a nonlinear load and a voltage dip in the system for a duration of 0.2 to 0.4 cycles. The waveform contain harmonic distortion with sag event as shown in the figure 10(a). The amplitude and slope outputs sag with harmonics signal are shown in the figures 10(b) and 10(c).

4) Voltage Outages
The Outages may be seen as a loss of voltage on the system for the duration of 0.5 cycles to 1min. The voltage outage waveform is shown in the figure 8(a). The amplitude and slope outputs of the voltage outage disturbance signal are shown in the figures 8(b) and 8(c).
7) Swell with Harmonics
This disturbance is caused by the presence of nonlinear load and a voltage swell in the system for a duration of 0.2 to 0.4 cycles. The waveform contains harmonic distortion with swell event as shown in the figure 11(a). The amplitude and slope outputs swell with harmonics signal are shown in the figure 11(b) and 11(c).

8) Flicker
This type of disturbance type is caused by the continuous and rapid variation of the system load. The waveform of the flicker is shown in the figure 12(a). The amplitude and slope outputs flicker signal are shown in the figure 12(b) and 12(c).

9) Notch
This is a disturbance of the nominal power voltage waveform lasting for less than half a cycle. The disturbance is initially of opposite polarity and hence it is to be subtracted from the waveform. The voltage notch waveform is shown in the figure 13(a). The amplitude and slope outputs signal are shown in the figure 13(b) and 13(c).

The classification performance of the method has been demonstrated through Table 3 and Fig 14.

5. CONCLUSION
This paper introduces a new method for the recognition and classification of various power quality disturbances using Kalman filter technique. The disturbance waveforms were generated through the Matlab parametric equations and the input features such as amplitude and slope were extracted through Kalman filter. Fuzzy expert system has been applied for classifying the various power quality disturbances. The method enables the accurate classification of all nine types of PQ disturbances. The classification accuracy has been validated by comparing the results obtained by the proposed technique against Kalman filter based neural classifier and it has been concluded that the proposed method performs better than those technique. The result shows that the proposed system performs very well in classification of PQ disturbances.
