Abstract

In today's world of fast changing technology where everything is governed by Internet directly or indirectly, the trend of crime has undergone a dramatic change over the past few years. Today, one can commit a crime with just a click of a button on laptop or computer and enjoy the garb of anonymity and impunity to a great extent. In such a scenario, it has become imperative to throw some light on the emerging issue of tackling cybercrimes in 21st century. This paper describes the extraction and analysis of volatile data that is available in computer’s RAM that is in a running state on windows operating systems and shows the utility of RAM in Computer Forensics that is often neglected while crime scenario with running system is encountered. Keeping in view this necessity, it is essential to consider the issues of digital evidence and their collection, preservation, and admissibility in the court of law.
