Abstract

Query optimization is a challenging task in database. Many different types of techniques are used to optimize queries. Heuristic Greedy, Iterative Improvement and Ant Colony algorithms are being used to query optimization. Ant colony algorithm is used to find the optimal solution for different types of problems. In this paper, we modify Ant Colony Algorithm for query optimization and will show the comparison execution time between Heuristic based optimization, Ant Colony Optimization and Modified Ant Colony optimization algorithms. After implementation of the existing algorithms and modified Ant Colony optimization algorithms, we found that modified Ant colony taking less computation time as compared to other algorithms.
