Effective communication plays an important role during requirements collection and implementation for any software system. In Global Software Development (GSD), its significance increases more as stakeholders are far away across the globe. In GSD challenges such as language differences and time zone differences exist, and thus proper and timely communication become more difficult. There is a need for practices effective communication during proper requirements elicitation and implementation in GSD. This study addresses validation of possible solutions and practices for effective communication from our previous study.
