ABSTRACT

Nowadays people are more oriented towards their health and fitness and yoga has been serving their purpose in a positive way. Yoga is a type of exercise in which you move your body into various positions in order to become more fit or flexible, to improve your breathing and to relax your mind. The technology has also evolved to the extent that people find every solution for their issues using the technology. It makes the life of people easier. This paper gives an overview of how yoga and technology can be brought together so that it helps the folks to choose the appropriate techniques of yoga to overcome their health issues.

General Terms

Yoga and Technology, Interactive app for yoga

Keywords

Cognitive neuroscience, Meditation analysis, EEG analysis

1. INTRODUCTION

Yoga is an ancient science derived from India. Practicing Yoga could make our brain keeping activity and physical function reaching to harmonious unity, thus promoting our physical health and improving the feeling of happiness[1][2]. Therefore, Yoga is being recognized more and more important as an old science.

The World Health Organization defined health in its broader sense in 1946 as "a state of complete physical, mental, and social well-being and not merely the absence of disease or infirmity." Seen from this definition, health depends on physical, mental and social well-being. Today, Yoga has become ancient health culture. As a relieving and relaxing exercise, Yoga has become one of the most fashionable body building exercises and is very popular with youngsters. As a static exercise, Yoga regulates bodies into good condition through posture, breathing, meditation and so on, and plays an important role in our physical, mental, spiritual and emotional health. In many countries, Yoga is taken as a method for treating diseases, such as asthma, diabetes, hypertension, arthritis, indigestion and so on.

Yoga is very popular because it may balance human beings’ mental system and endocrine system, thus exerting direct influence on human beings’ other systems and getting them balanced. For modern city women and men, Yoga may regulate their emotions, relieve them of their stress resulting from fast life pace, eliminate the toxin in bodies, increase their energy, and burn the fat to keep fit, get into shape and preserve our health. Yoga is applicable to human beings of all ages, and helps to reduce the load on heart. More and more human beings expect to have their health improved, their bad emotions and ill temper eliminated and their mental, physical and social adaptability improved through Yoga. Men may be mentally and physically regulated by practicing Yoga to be adapted to the society better and have their work and quality of life improved. Yoga is the oldest way for strengthening bodies and the most fashionable way for body building, which focuses on “combining healthy spirit with healthy bodies” so that we may be physically and mentally harmonious.

In addition, Yoga helps us to pick up the quality of keeping calm and objective, the attitude of taking things as they are, sturdiness and gracefulfulness so that you may get the joy and happiness of life. Yoga is to reach proper positions in a comfortable way stably by moving slowly, flexibly at ease to be stretched to the maximum extent by consuming the least energy. Yoga consists of a lot of postures, about 20-30 in practice. For Yoga, the harmony depends on your concentration on your practice instead of your nice posture. Everyone may practice Yoga, and may get into a good condition through different postures. Yoga is characterized in that those who practice Yoga may enjoy the process both physically and mentally, and is good for bodies, minds, spirit, emotions and so on.

According to medical explanation, Yoga is good because it may balance nervous system and endocrine system of human bodies, thus exerting influence on other systems and reaching a balance as a whole beauty in appearance instead of the innermost being. By contrast, while Yoga shapes you, it may also provide you with internal power. After a period of Yoga exercise, you will be surprised to find that your innermost being has been changed. You will not torture yourself for the purpose of losing weight and you will be beautiful because you are happy, thus being physically and mentally trained without any auxiliary body building instruments or tools.

Neither yoga is like other body building sports that are limited by the field such as ball, swimming and so on. You shall not just spend some time on practicing asana or meditation, instead, the concept of Yoga shall be reflected throughout your life. For instance, you shall select natural environment for living, bland diet, relaxing music, become outgoing and calm.

Yoga is never like general body building sports, and advocates the life philosophy of “harmony of body and mind”.

International Journal of Computer Applications (0975 – 8887)
Volume 182 – No. 48, April 2019
Wu et al. [2] opines that Yoga exercise could promote our physical health and improve the feeling of happiness, so it is becoming more and more popular and the establishment of Yoga learning and self-instruction expert system has great significance for the popularization and spread of Yoga. In the research, the author analyses the Yoga training knowledge is analyzed using POAD expert system model, Yoga learning and self-instruction expert system is established taking Yoga training technique problem as framework, the definitions of MP4 objects in Yoga knowledge are given, system operation mechanism is designed accustomed to Yoga training, and Yoga learning and self-instruction expert system Yoga Expert is developed.

Baglio et al. [3] in their work studied the spatial power distribution in Magnetoencephalography (MEG) data collected in a subject performing two different yoga breathing exercises specific for the treatment of obsessive compulsive disorder. They reconstructed, in relation with all the frequency components, a characteristic spatial structure of power distribution using the correlation function for both the recordings, through the power spectral analysis, the characterization of the gamma-band activity was carried out on allowing to underline the differences due to the activities of different phases of the same protocol and the effects of performing different breathing exercises.

Howorka et al. [4] in their work suggested that Experience with frequency domain analysis of the heart rate variability represents an effective non-invasive tool for cardiac risk stratification and assessment of autonomic function e.g. in diabetes and hypertension, in both the experimental and clinical settings. The method proposed could be used to assess the acute influence of yoga and short-time moderate exercise on the autonomic cardiac regulation. They demonstrated the immediate decrease of sympathetic and increase of parasympathetic activity after yoga.

Yunhai et al. [5] studied the complexity of heartbeat dynamics during specific traditional forms of Chinese Chi and Kundalini Yoga meditation in healthy young adults. The technique based on the algorithm of permutation entropy to heartbeat interval time series was analysed. The entropy of these oscillations during meditation was significantly less than those in the pre-meditation state. The results show it is feasible that permutation entropy (PE) index can be used to analyze the effect of Chi and Yoga to restrain HRV.

Jae Won Bang et al. [6] proposed a new method that combines an EEG acquisition device and a frontal viewing camera to isolate and exclude the sections of EEG data containing these noises. This method is novel in the following three ways. First, the accuracy of detecting head movements based on the features of EEG signals in the frequency and time domains and on the motion features of images captured by the frontal viewing camera is compared. Second, the features of EEG signals in the frequency domain and the motion features captured by the frontal viewing camera are selected as optimal ones. The dimension reduction of the features and feature selection are performed using linear discriminant analysis. Third, the combined features are used as inputs to support vector machine (SVM), which improves the accuracy in detecting head movements. The experimental results of authors show that the proposed method can detect head movements with an average error rate of approximately 3.22%, which is smaller than that of other methods.

Vijayaragavan et al. [7] proposed the idea to develop a passage that serves as an effective solution to overcome this...
problem by providing people with a smart phone application based integrated solution which makes use of Yoga and Music Therapy techniques. The objective was to bring about relaxed state of mind by monitoring the EEG readings of a person while subjecting him to Yoga & Music therapy simultaneously through an efficient Android Application which can restore the calm state of mind for the user during any stressed conditions.

Shaw et. Al[8] In their work did a comparative study to classify the resting brain state associated with Kriya Yoga meditation practice using SVM and Kernel-SVM (k-SVM). The EEG signals were captured from ten non-meditators (control group) and 23 meditators group. The results of both SVM and k-SVM were compared in both the groups. Additionally, the average classification accuracy was found to be 85.543% for SVM and 90.8259% for k-SVM. The obtained results showed that the kernel-based SVM surpassed the conventional SVM in classifying the meditation and non-meditation allied EEG.

Godse et. al[9] The aim of the present research was to study the effects of suryanamaskar on R-dispositions among college students with high stress. Participants eligible for the study, that is, high-stress symptoms were subjected to suryanamaskar and control group. Differences on various R-dispositions and stress dispositions were studied. The mean differences for the subscales indicate that sleepness and stress reduced as a disposition and there was an increase in physical relaxation, mental quietness, ease and peace, being refreshed, strength and awareness, and joy. The observed effects on the above stated R-dispositions can be attributed to components of suryanamaskar. It is clear that a 2 weeks program helps participants to reach the state of a quiet mind at a dispositional level.

Woodyard [10] in their work says that yoga is rapidly emerging in the Western world as a discipline for integrating the mind and body into union and harmony, when adopted as a way of life, yoga improves physical, mental, intellectual and spiritual health. Yoga offers an effective method of managing and reducing stress, anxiety and depression and numerous studies demonstrate the efficacy of yoga on mood related disorders.

Jagannathan et. Al[11] describes the development of a yoga program aimed to reduce burden and improve coping of family caregivers of inpatients with schizophrenia in India. This study was one of the first studies to use a sound methodology of inductive enquiry model for the development of a need-based yoga program for caregivers of in-patients with schizophrenia in India. The findings were highly indicative and future studies could test the efficacy of the program with a larger quantitative sample to confirm its validity.

Ramanathan et. Al[12] undertook a study to evaluate the effectiveness of yoga on the mental health status of elderly women inmates residing in a hospice in Pondicherry. The influence of yoga in the reduction of depression and anxiety scores and improvement in self-esteem scores in elderly women subjects was evident from this study. This may be attributed to changes in central neurotransmitters such as gamma-amino butyric-acid coupled with increased parasympathetic tone and decreased sympathetic-adrenal activity. It was recommended that yoga should be a part of health-care facilities for elderly as it could enhance the quality of life by improving their overall mental health status. It could provide a healthy and positive alternative from depressing negative thoughts, and give them a sense of purpose and hope, reliability, and generalizability.

Moliver et. Al[13] examined the extent to which psychological attitudes, transcendence, mental mastery, and subjective vitality in a sample of female yoga practitioners over 45 years varied according to the length and frequency of yoga practice. There were significant positive relationships between yoga experience and all outcome variables. These significant relationships remained after accounting for age and lifestyle factors. When authors computed yoga experience in terms of total calendar years, without accounting for hours of practice, significant relationships did not remain. Transcendence of the ordinary was the most strongly associated with current yoga practice frequency, and positive psychological attitudes were the most strongly associated with total lifetime hours of practice.

Hawkins et. Al[14] investigated the impact of participating in yoga classes on the amount of exercise behaviour and perception of physical exertion when compared to non-structured exercise sessions between two young adults with ID in a post-secondary education setting. The data from this study indicated a functional relationship between participation in yoga exercise classes and amount of exercise behaviour. There was a sharp increase in physical exertion for both subjects when they participated in a yoga exercise program as opposed to non-structured exercise. The author opined that if there was increase in exercise and continued over an extended period of time, it might help in reducing the likelihood of developing chronic health diseases and improving physical fitness levels. [15] Enjoyment during the yoga intervention remained within an enjoyable range and both students voluntarily continued attending yoga classes upon the conclusion of the study.

Researchers at Teesside University in the U.K. investigated how combining cognitive activities and elements of yoga, tai chi, qigong and meditation with routine physical exercise affected dementia patients. They found that a holistic exercise program focusing on both mind and body can help improve quality of life for dementia patients.[16]

Ansari [17] in the work opined that Kapalabhati effectively targets and combats the features of MS. Since PCOS and MS share a common pathogenic pathway, it was worthwhile to consider that Kapalabhati can be effective against the features of PCOS too, though there was a dearth of studies and literature in this regard. On a positive note, Kapalabhati would help to address infertility in PCOS women, a main cause of concern in women of reproductive age.

Khemka et. Al[18] studied on evaluation of the effects of integral yoga practices on these variables and also the consistency of correlations observed between them. Significant pre-post changes were found in all variables. Significant correlations were found between the following pairs: The two sustained attention variables; emotional intelligence and general health; GHQ and tamas; sattva and tamas; and rajas and tamas. The study showed that there were significant changes in all variables (P< 0.001) except in sattva. It also confirmed that EQ and general health variables correlate significantly with each other and negatively with tamas. EQ and tamas form positive and negative predictors of health respectively. Sattva correlates positively with EQ suggesting that a sattvic personality indicates better self-control. This suggests that, by improving guna personality, long-term yoga practice may stabilize EQ.
Gururaja et. Al[19] conducted a study in Japan to find the effect of yoga on mental health between young and senior people. Reduction in State and Trait anxiety score signifies that yoga has both immediate as well as long-term effect on anxiety reduction. Thus author opines that yoga helps to improve the mental health in both the groups.

Jimenez et. Al[20] suggested that HY asanas, practiced as a systematic physical activity and conducted by an expert instructor in untrained and aging individuals, can improve health and serve as the basis for a physically active lifestyle.

Deshpande et. Al[21] demonstrated that an eight week intervention of an integrated yoga module decreased verbal aggressiveness in the yoga group (in males and those below 25 years of age), with a no significant increase in the PE group.

4. METHODOLOGY

Stage 1: Sample collection from faculty of Engineering college

At the initial stage, Participants/Subjects are identified from in and around the institution. Using the device EMOTIV EPOC + (a 14 channel portable and handy brain activity map capturing instrument)/ Brainsense/Neurosky mindwave mobile, the EEG signals and brain activity map is captured before the subject is performing the pranayama. Along with this, a response for a self administered questionnaire is also collected from subjects. The faculty are asked to wear the devices for a period of six hours a day for the data or sample collection.

Stage 2: Analysis of Data

The collected brain activity map and EEG signals are analyzed by converting the analog data into digital format. The data obtained here will be a single valued data with the time stamp. The EEG data is analyzed with the help of a neurologist and cognitive behavior of a person is studied with the help of a psychologist. The digitalized EEG data is assessed and analyzed using a method called one way ANOVA (Analysis of Variance). Along with this, the responses an individual gives for the self administered questionnaire is analyzed by combining the data and the transformation in reducing anger, anxiety and tension that has been observed in an individual is exhibited.

Stage 3: Finding the inferences

The EEG signals and brain activity map is again collected from the subjects while performing yoga/pranayama which serves as the test data. After the stipulated time again, the individual is tested for the EEG regularly to analyze the changes in the health of a person. The result from EEG and questionnaire is analyzed by combining them and the transformation in reducing anger, anxiety and tension that has been observed in an individual is exhibited.

Stage 4: Development of intelligent system

After the analysis of the data or samples obtained, a prototype is modeled so as to help an individual to control his emotions. An IoT device would be prepared which detects the state of emotions of a person and at a preliminary stage would give an alarm to the individual to control his state of emotion.
5. CONCLUSION
People are looking out in positive way of living by keeping their health in a good condition. To improve breathing and relax, people tend to use the yogic way of exercising which provides a way to overcome every health issue in a natural way by strengthening the immune system. The technology has improved drastically and every single thing can be found using means of technology. In this paper an overview of how yoga and technology can be brought together is given, an idea to produce an interactive system so as to help people control their emotions using yoga and get the best out of them.

6. ACKNOWLEDGMENTS
Our sincere thanks to the Principal of the institute who has been our support for the work being carried out, experts who have contributed towards the work.
