Abstract

Here I define a new labeling and a new graph called square difference labeling and the square difference graph. Let G be a (p, q) graph. G is said to be a square difference graph if there exists a bijection $f: V(G) \rightarrow \{0, 1, \ldots, p-1\}$ such that the induced function $f^*: E(G) \rightarrow N$ given by $f^*(uv) = |f(u)^2 - f(v)^2|$ for every $uv \in E(G)$ are all distinct. A graph which admits square difference labeling is called square difference graph. In this paper I discussed the square difference labeling is admitted for some graphs like cycles, complete graphs, cycle cactus, ladder, lattice grids, wheels, quadrilateral snakes, the graph $G = K_2 + m K_1$.
