Abstract

Compression helps in reducing the redundancy in the data representation so as to reduce the storage requirement of it. The task of compression consists of two components, an encoding algorithm that takes a message and generates a "compressed" representation and a decoding algorithm that reconstructs the original message or some approximation of it from the compressed representation. Many algorithms are available for compressing the data. Some of the algorithms help in achieving lossless compression and some are good at lossy compression. In this paper, the proposed technique has improved the better compression ratio and compression efficiency on the Huffman Coding on data. The proposed technique works even with image file also but conventional Huffman Algorithm cannot do this. This paper also outlines the use of Data Normalization on the text data so as to remove redundancy for more data compression.
