Abstract

Consumers occasionally find difficulty in finding the location of a store or business place they want because there is little information to be found and the information is usually subjective. Web-based GIS technology can be used to search for business place so the consumer can easily find the store or business place they want, along with the address. On the other hand, businesspeople also receive benefit because this system gives the opportunity to promote their businesses. This system was built using concept of web-based geographic information system where there was a map from Google Map API inside the web to make finding the location easier.
