Abstract

This paper presents a decoupled control strategy using time-varying sliding surface-based Sliding Mode Controller (SMC) for a multivariable nonlinear system as an Ammonia Reactor system. The decoupled method provides a simple way to achieve asymptotic stability by dividing the system into three subsystems. Simulation results are presented for SMC comparing with a traditional PID controller. Then, the system is subjected to temperature disturbance to demonstrate the effectiveness and robustness of the controller.
Decoupled Sliding Mode Control for a Multivariable Nonlinear System
