Abstract

Hospital is a public health service institution. There are many social interactions in Hospital, between medical patients, doctors, nurses, and other people in Hospital. Social interaction in that community can be managed into a social network website. Social network website that designed not only for connected user in community, but also electronic medical record (EMR) and wiki added too. The web designed to combine little part of hospital management information system (Electronic Medical Records) and social network web. In Addition, web which designed able to handle data from many hospitals with numerous user into one web. It all became the new value of this research. The result is a design of social network website for hospital community that able to handle data from many hospitals.
