Abstract

This paper explores the possibility of applying fuzzy logic theory for handling vagueness and imprecision that characterize the decision making process. Fuzzy metagraph framework is developed to carry out the required analysis for arriving at the governance rating of the firms. A person carrying a share of a company holds that part of ownership in that company. Share is nothing but the Ownership of the company divided into small parts and each part is called as Share or Stock. Share market is the place where buying and selling of shares takes place, with the use of computer display datas on screen. A person holding maximum shares carry maximum ownership and designated like director, chairman etc. This research work will help the customer for decision making in share market.
