Abstract

Wireless sensor networks emphasize in most of the real world applications such as military applications, medical field and home appliances and so on. Sensors used in such applications do not provide any confidentiality, however it is been used in almost all the areas in our day-to-day life. Usually sensors were used in buildings after the construction. This work presents a solution which ensures security using sensors in building constructions. In particular, this work proposes an intelligent method that provides security for banking purpose.
