Handwritten recognition is an area of research where many researchers have presented their work and is still an area under research to achieve higher accuracy. In past collecting, storing and transmitting information in the form of handwritten script was the most convenient way and is still prevailing as a convenient medium in the era of digital technology. As technology has advanced, tablets and many similar devices allow humans to input data in the form of handwriting. Use of paper to write handwritten text, converting to an image using scanner, identifying handwritten characters from the image is known as off-line handwritten text recognition. It is a challenging area due to the fact that different people will have different styles of writing and all scripts have their own character sets and complexities to write text. Many researchers have presented their work and many algorithms are proposed to recognize handwritten and printed characters. One can trace extensive work for off-line handwritten recognition for English and Arabic script. This paper presents a review of work to recognize off-line handwritten text for various Indian language scripts. Paper reviews methodologies with respect to the phases of character recognition.
