Abstract

With the increase in the amount of information available on the internet, there is a challenge of providing relevant and useful information to the interesting users on the basis of their interest although when user wants to search data of their interest, they have to search in whole databases, which is very tedious and time consuming too. So a system is needed which provide useful information based on user interest named Recommendation System. A Recommendation System is a sturdy and valuable tool used for decision making and provides a ranking of the most popular items based on user preference. Various algorithms were proposed by different researchers for recommendation of web pages, items, movie, video etc. This paper gives us a snapshot of latest work accomplished in the field of recommendation.
