Abstract

In today’s World, the consumption of internet content has increased manifold. There are various applications to track this consumption at individual levels, but none to do it for a closed group like a family or a class or a project team. Our work proposes an application which not only tracks the internet consumption of the individuals but also collaborates it for a social group and displays the summary in a categorical format. The categorization done is based on type and level of the internet content. The result of this application can be customized on the basis of inputs given by a user, providing a very crisp summary which has a plethora of practical advantages to various sections of society.
