Abstract

This paper is based on an easily comprehensible algorithm to sort Bangla words in the linguistic order. Though a few works has been done on this project, only a few served the purpose. Since Unicode serves as a standard and a fixed representation for all characters of most of the language, Unicode representation of Bangla characters has been used to sort thousands of words in a linguistic order in this method. This method which requires a mapping can sort any Bangla word without keyboard dependency. This method is open for future modification so that changing the sorting algorithm to be used does not affect the whole algorithm.
