Abstract

A mobile ad hoc network is an autonomous system of mobile nodes connected by wireless links. The nodes are free to move about and organize themselves into a network. For many application of MANET we need to establish secure group communication between members of groups. Some of the protocols to generate group key have been surveyed, and then their comparison is given based on the fact that if we divide the region into small region than the control overhead can be minimized. Numerical analysis is given to prove the result.
