Abstract

The success of Web technology has built e-Learning a common success way of education and training. To provide online automatic adaptive learning content, this paper suggests a framework for building such learning management systems based on MAS (Multi Agent System), Semantic web ontology, and learners' preference knowledge base for content resource organization, sequencing (learning path) and adaptation. This system has been built...
upon a famous learning management system called MOODLE and it facilitates and demonstrates the simulation in a real time teaching learning process. The result also show that the proposed e-Learning system has the highest possibility of score / rank gain in the selection of learning object retrieval technique
