Abstract

Security of the data which flow over internet it highly insecure because every data is crucial to every user and most important to which data is related. There are already many more encryption and decryption algorithm to protect over data over internet from that I had proposed some new technique of the data protection. Since genetic algorithm nowadays mostly used in building robotic, artificial intelligence to way to think and behave like expert human system to take decision so I think to implement genetic algorithm over data across internet to immerge to era of encryption technique in the term of the security.
Security of Data over Internet using Genetic Algorithm
