Abstract

Regularly shaped compact microstrip antennas have a small size but their gain is insufficient for most applications. Therefore, a ring-shaped compact microstrip reflectarray with microstrip antenna feed has been proposed. Different configurations, namely, $1 \times 3$, $3 \times 1$, plus-shaped and $3 \times 3$ have been analyzed. The $3 \times 3$ configuration yields an optimum gain of 10.8 dBi and a narrow beamwidth of 22.7°.
