Abstract

Compact shorted 1350 Sectoral microstrip antenna derived from 2700 Sectoral microstrip antenna is proposed. On thicker air substrate \((h > 0.1\sqrt{\lambda})\) it yields bandwidth of more than 350 MHz (35\%). To increase the bandwidth, its rectangular slot cut variation is proposed. The slot reduces the resonance frequency of higher order \(TM_{1/4,1}\) mode of the shorted patch and along with fundamental \(TM_{1/4,0}\) mode, yields bandwidth of more than 500 MHz (>50\%). The realized bandwidth in shorted slot cut Sectoral microstrip antenna is nearly the same as that given by 2700 Sectoral patch, but with 50\% reduction in patch area. Due to shorted patch, proposed antenna gives gain of around 3 dBi over the entire bandwidth.
