Abstract

Automobiles are changing every day. It gets easier to drive a car when time moves on. The application of Artificial Intelligence results in smart cars which is always smarter than human drivers. Number of experiments done in this field and lot of them gave appreciable results. However a fully autonomous car is still in research. The smart cars at present only give an intelligent assistance to the driver. And we already realized a fully automated transportation is only possible by a combination of intelligent car and an assisting traffic system for it. The path which it use are also to be considered. Modern technologies like GPS must be utilized for achieving this goal. In this paper we tried to solve the difficulties in turning an autonomous
Intelligent Turning System for A Smart Car

vehicle.
