Abstract

The use of a latent heat storage system using phase change materials (PCMs) is an effective way of storing thermal energy (solar energy) and has the advantages of high-energy storage.
density and the isothermal nature of the storage process. The different variety of PCMs widely used for latent heat thermal storage system. The used of PCMs for heating and cooling application for building, solar water heating, solar cooking, greenhouses, waste heat recovery system. This review paper will help to find suitable PCMs for solar water heating and it will also help to provide a variety of design to store heat using PCMs (solar energy) for solar water heating.
