Abstract

Indian agriculture includes a mix of traditional to modern farming techniques. In some parts of India, traditional use of cattle to plough farms remains in use. Traditional farms have some of the lowest per capita productivities and farmer incomes. "Slow agricultural growth is a concern for policymakers as some two-thirds of India's people depend on rural employment for a living. Current agricultural practices are neither economically nor
Implementation and Design of Fuzzy ID3 to Forecast Seasonal Runoff

environmentally sustainable and India's yields for many agricultural commodities are low. Poorly maintained irrigation systems and almost universal lack of good extension services are among the factors responsible. Farmers' access to markets is hampered by poor roads, rudimentary market infrastructure, and excessive regulation. "This paper will be developed by me, a hybrid forecasting technique that is mixture of fuzzy logic and ID3 data mining algorithm. That forecast seasonal runoff on the basis of every day weather conditions. Moreover it to get the authenticity of the system we compare the system with a traditional ID3 based system.
