Abstract

To facilitate the ease of searching the images in social websites through tags, a social re-ranking system is proposed for tag-based image retrieval considering the image's relevance and diversity. The input images that are tagged by different social users are taken from social websites. This paper includes, sorting the input images based on inter user re-ranking. Users having higher contribution to the given query rank higher, Intra-user re-ranked on the ranked user's image set. The most relevant image from each user's image set is selected. An inverted index structure is built for the social image dataset to accelerate the searching process.
