Abstract

A Library Management robot is device to help any libraries which are still using the old way to manage their library. The old way like searching for a book using manual work is hassle, fast
Wireless Pick and Place Library Management Robot

Report generation is not possible, information about issue/return of the books are not properly maintained, as information about the issued book is not available so database cannot be created. But by using this, user can overcome all the problems mentioned above. This system can manage all the happenings of the library.
