## ABSTRACT

In this paper, we introduce the new notions  $\tau^*$ - $g\lambda$ - closed sets and  $\tau^*$ - $g\lambda$ - open sets  $\tau^*$ - $g\lambda$ - continuous maps in Topological spaces. Also we introduce a new space called  $T_{\tau^* - g\lambda}$ - space. We study some of its properties in Topological spaces.

## General Terms

2000 Mathematics Subject Classification: 54A05

## Keywords

$\tau^*$ - $g\lambda$ - closed sets ,  $\tau^*$ - $g\lambda$ - open sets ,  $\tau^*$ - $g\lambda$ - continuous maps,  $T_{\tau^* - g\lambda}$ - space.

## 1. INTRODUCTION

In 1970, Levine[9] introduced the concept of generalized closed sets as a generalization of closed sets in topological spaces. Using generalized closed sets, Dunham[8] introduced the concept of the closure operator  $cl^*$  and a new topology  $\tau^*$  and studied some of their properties. P.Arya[3],P.Bhattacharyya and B.K.Lahiri[5], J.Dontchev[7], H.Maki, R.Devi and K.Balachandran[12], [13], P.Sundaram and A.Pushpalatha[19] introduced and investigated generalized semi closed sets, semi generalized closed sets, generalized semi preclosed sets,  $\alpha$ - generalized closed sets, generalized- $\alpha$  closed sets, strongly generalized closed sets,  $g\lambda$ - closed sets respectively.

In this paper, we obtain a new generalization of closed sets in the weaker topological space  $(X, \tau^*)$ . Throughout this paper  $X$  and  $Y$  are topological spaces on which no separation axioms are assumed unless otherwise explicitly stated. For a subset  $A$  of a topological space  $X$ ,  $int(A)$ ,  $cl(A)$ ,  $cl^*(A)$ ,  $scl(A)$ ,  $spcl(A)$ ,  $cl\alpha(A)$  and  $A^c$  denote the interior, closure, closure\*, semi-closure, semipreclosure,  $\alpha$ -closure and complement of  $A$  respectively.

## 2. PRELIMINARIES

### Definition 2.1

A subset  $A$  of  $X$  is called

- (a) semi open [8] if there exists an open set  $G$  such that  $G \subseteq A \subseteq cl(G)$  and semi closed if there exists a closed set  $F$  such that  $int(F) \subseteq A \subseteq F$ .

Equivalently, a subset  $A$  of  $X$  is called semi-open if  $A \subseteq cl(int(A))$  and semi closed if  $A \supseteq int(cl(A))$

- (b)  $\alpha$ -closed if  $cl(int(cl(A))) \subseteq A$  and an  $\alpha$ -open if  $A \subseteq int(cl(int(A)))$  [17].

- (c) pre-closed if  $cl(int(A)) \subseteq A$  and pre-open if  $A \subseteq int(cl(A))$  [14].

### Definition 2.2

A subset  $A$  of  $X$  is called a

- (a) generalized closed( $g$ -closed) set if  $cl(A) \subseteq G$  whenever  $A \subseteq G$  and  $G$  is open in  $X$  and generalized open if  $A^c$  is  $g$ -closed set in  $X$  [9].
- (b) generalized semi closed ( $gs$ -closed) if  $scl(A) \subseteq G$  whenever  $A \subseteq G$  and  $G$  is open in  $X$  and generalized semi open if  $A^c$  is  $gs$ -closed set in  $X$ [3].
- (c) generalized  $\alpha$ -closed ( $g\alpha$ -closed) if  $\alpha cl(A) \subseteq G$  whenever  $A \subseteq G$  and  $G$  is  $\alpha$ -open in  $X$  and generalized  $\alpha$ -open if  $A^c$  is  $g\alpha$ -closed set in  $X$ [13].
- (d) generalized semi-preclosed set ( $gsp$ -closed) if  $spcl(A) \subseteq G$  whenever  $A \subseteq G$  and  $G$  is open in  $X$  [7].
- (e)  $b$ -closed if  $int(cl(A)) \cap cl(int(A)) \subseteq A$ [2]
- (f)  $g^*$   $\alpha$ -closed set if  $\alpha cl(A) \subseteq \square U$  whenever  $A \subseteq \square U$  and  $U$  is  $g\alpha$ -open in  $X$  [16]
- (g) strongly  $g^*$   $\alpha$ -closed set if  $\alpha cl(A) \subseteq \square U$  whenever  $A \subseteq \square U$  and  $U$  is  $g^*$   $\alpha$ -open in  $X$ . [15]
- (h)  $\hat{g}$ -closed if  $cl(A) \subseteq G$  whenever  $A \subseteq G$  and  $G$  is semi-open in  $X$  [20]

### Definition 2.3

A subset  $A$  of a topological space  $X$  is called a  $\lambda$ -closed set in  $X$  if  $A \supseteq cl(G)$  whenever  $A \supseteq G$  and  $G$  is open in  $X$ . [14]

### Remark 2.4

- (i) Every closed set is  $\hat{g}$ -closed [20]
- (ii) Every  $\hat{g}$ -closed is  $g$ -closed [20]

### Definition 2.5

A function  $f: X \rightarrow Y$  is called

- (i) semi continuous ( $s$ -continuous) if  $f^{-1}(V)$  is semi-closed in  $X$  for each closed set  $V$  in  $Y$  [10].
- (ii) generalized continuous ( $g$ -continuous) if  $f^{-1}(V)$  is  $g$ -open in  $X$  for each open set  $V$  in  $Y$  [18].
- (iii) generalized semi continuous ( $gs$ -continuous) if  $f^{-1}(V)$  is  $gs$ -closed in  $X$  for each closed set  $V$  in  $Y$  [3].

- (iv)  $\hat{g}$  – continuous if  $f^{-1}(V)$  is  $\hat{g}$ - closed in X for each closed set V in Y [21].

### Definition 2.6

For the subset A of a topological X, the generalized closure operator  $cl^*[5]$  is defined by the intersection of all g-closed sets containing A.[8]

### Definition 2.7

For the subset A of a topological X, the topology  $\tau^*$  is defined by  $\tau^* = \{G : cl^*(G^c) = G^c\}$ [8]

### Definition 2.8

A subset A of a topological space X is called a  $\tau^*$ - g - closed set in X if  $cl^*(A) \subseteq G$  whenever  $A \subseteq G$  and G is  $\tau^*$ - open in X. [18]

### Remark 2.9

- (i) Every closed set in X is  $g$  –closed [9]  
 (ii) Every closed set in X is  $\tau^*$ -g-closed.[18]  
 (iii) Every g-closed set in X is a  $\tau^*$ -g-closed set but not conversely.[18]

## 3. $\tau^*$ - g $\lambda$ – CLOSED SET IN TOPOLOGICAL SPACES

In this section, we introduce the concept of  $\tau^*$ -  $g\lambda$ –closed sets in topological spaces and study some of its properties.

### Definition 3.1

A subset A of a topological space X is called a  $\tau^*$ -  $g\lambda$ – closed set in X if  $A \supseteq cl^*(G)$  whenever  $A \supseteq G$  and G is  $\tau^*$ - open in X.

### Theorem 3.2

Every closed in X is  $\tau^*$ -  $g\lambda$ –closed in X but not conversely.

### Proof

Assume that A be a closed set in X. Let G be an  $\tau^*$ - open set in X such that  $A \supseteq G$ . Then  $cl^*(A) \supseteq cl^*(G)$ . But  $cl^*(A) = A$ . Therefore  $A \supseteq cl^*(G)$  and hence A is  $\tau^*$ -  $g\lambda$ –closed in X.

### Example 3.3

Let  $X = \{a, b, c\}$  be a topological space with topology  $\tau = \{\phi, X, \{a\}\}$ . The sets  $\{a\}, \{b\}, \{c\}, \{a,b\}$  and  $\{a,c\}$  are  $\tau^*$ -  $g\lambda$  - closed, but it is not closed in X.

### Theorem 3.4

Every  $\tau^*$ - closed set in X is  $\tau^*$ -  $g\lambda$ – closed set in X but not conversely.

**Proof:** Assume that A be a  $\tau^*$ - closed set in X. Let G be an  $\tau^*$ - open set in X such that  $A \supseteq G$ . Then  $cl^*(A) \supseteq cl^*(G)$ . Since A is  $\tau^*$ - closed set,  $cl^*(A) = A$ . Hence A is  $\tau^*$ -  $g\lambda$ – closed in X.

### Example 3.5

Let  $X = \{a, b, c\}$  be a topological space with topology  $\tau = \{\phi, X, \{a,b\}\}$ . The sets  $\{a\}$  and  $\{b\}$  are  $\tau^*$ -  $g\lambda$ – closed, but it is not  $\tau^*$ - closed in X.

### Theorem 3.6

Every  $\tau^*$ - g- closed set in X is  $\tau^*$ -  $g\lambda$ – closed set in X but not conversely.

**Proof:** Assume that A be a  $\tau^*$ - g-closed set in X. Let G be an  $\tau^*$ - open set in X such that  $A \supseteq G$ . Then  $cl^*(A) \supseteq cl^*(G)$ . Since A is  $\tau^*$ - g - closed set,  $cl^*(A) \subseteq G$ . Hence A is  $\tau^*$ -  $g\lambda$ – closed in X.

### Example 3.7

Let  $X = \{a, b, c\}$  be a topological space with topology  $\tau = \{\phi, X, \{b,c\}\}$ . The sets  $\{c\}$  and  $\{b\}$  are  $\tau^*$ -  $g\lambda$  - closed, but it is not  $\tau^*$ -g - closed in X.

### Theorem 3.8

If A and B are  $\tau^*$ -  $g\lambda$  - closed sets in a topological space X, then  $A \cap B$  is  $\tau^*$ -  $g\lambda$  - closed in X.

**Proof:** Let  $A \cap B \supseteq G$ , where G is  $\tau^*$ - open.

$$\Rightarrow A \supseteq G, B \supseteq G$$

$$\Rightarrow A \supseteq cl^*(G), B \supseteq cl^*(G), \text{ since A and B are } \tau^* \text{- } g\lambda \text{- closed.}$$

$$\Rightarrow A \cap B \supseteq cl^*(G)$$

$$\Rightarrow A \cap B \text{ is } \tau^* \text{- } g\lambda \text{- closed.}$$

### Remark 3.9

If A and B are  $\tau^*$ -  $g\lambda$  - closed in X, then their union need not be  $\tau^*$ -  $g\lambda$ – closed in X as seen from the following example.

### Example 3.10

Let  $X = \{a, b, c\}$  be a topological space with topology  $\tau = \{\phi, X, \{a, b\}\}$ . The sets  $\{a\}$  and  $\{b\}$  are  $\tau^*$ -  $g\lambda$  - closed, but their union  $\{a, b\}$  is not  $\tau^*$ -  $g\lambda$ – closed in X.

**Theorem 3.11:** Every  $g$  – closed set in X is  $\tau^*$ -  $g\lambda$ – closed set in X but not conversely

**Proof:** Assume that A be a  $g$ – closed set in X. Let G be an  $\tau^*$ - open set in X such that  $A \supseteq G$ . Then  $cl^*(A) \supseteq cl^*(G)$ . Since A is  $g$  - closed set,  $cl^*(A) = A$ . Therefore  $A \supseteq cl^*(G)$  and hence A is  $\tau^*$ -  $g\lambda$  - closed in X.

### Example 3.12

Let  $X = \{a, b, c\}$  be a topological space with topology  $\tau = \{\phi, X, \{a\}\}$ . The set  $\{a\}$   $\tau^*$ -  $g\lambda$  - closed, but it is not  $g$  – closed in X.

### Theorem 3.13

Every  $\hat{g}$  – closed set in X is  $\tau^*$ -  $g\lambda$ – closed set in X but not conversely.

**Proof:** By Theorem 3.11 and by Remark 2.4, it follows the proof

**Example 3.14**

Let  $X = \{a, b, c\}$  be a topological space with topology  $\tau = \{ \emptyset, X, \{b\} \}$ . The set  $\{b\}$  is  $\tau^*$ - $g\lambda$ -closed, but it is not  $\hat{g}$ -closed in  $X$ .

**Example 3.15**

Let  $X = \{a, b, c\}$

- (i) The concepts of  $gs$ -closed sets and  $\tau^*$ - $g\lambda$ -closed are independent as seen from the following examples. Consider the topology  $\tau = \{ \emptyset, X, \{a\} \}$ . Then the set  $\{a\}$  is  $\tau^*$ - $g\lambda$ -closed but not  $gs$ -closed. In the topology  $\sigma = \{ \emptyset, X, \{a\}, \{b\}, \{a, b\} \}$ , the sets  $\{a\}$  and  $\{b\}$  are  $gs$ -closed but not  $\tau^*$ - $g\lambda$ -closed.
- (ii) The concepts of  $\lambda$ -closed sets and  $\tau^*$ - $g\lambda$ -closed are independent as seen from the following examples. Consider the topology  $\tau = \{ \emptyset, X, \{a\} \}$ . Then the sets  $\{a\}, \{a, b\}, \{b, c\}$  are  $\tau^*$ - $g\lambda$ -closed but not  $\lambda$ -closed. In the topology  $\sigma = \{ \emptyset, X, \{a\}, \{a, b\} \}$ , the sets  $\{b\}$  and  $\{c\}$  are  $\lambda$ -closed but not  $\tau^*$ - $g\lambda$ -closed.
- (iii) The concepts of  $w\lambda$ -closed sets and  $\tau^*$ - $g\lambda$ -closed are independent as seen from the following examples. Consider the topology  $\tau = \{ \emptyset, X, \{a\}, \{a, b\} \}$ . Then the set  $\{c\}$  is  $\tau^*$ - $g\lambda$ -closed but not  $w\lambda$ -closed. In the topology  $\sigma = \{ \emptyset, X, \{a\}, \{a, b\} \}$ , the sets  $\{a, c\}$  are  $w\lambda$ -closed but not  $\tau^*$ - $g\lambda$ -closed.
- (iv) The concepts of  $g^*\alpha$ -closed sets and  $\tau^*$ - $g\lambda$ -closed are independent as seen from the following examples. Consider the topology  $\tau = \{ \emptyset, X, \{a\} \}$ . Then the sets  $\{a\}, \{a, b\}, \{b, c\}$  are  $\tau^*$ - $g\lambda$ -closed but not  $g^*\alpha$ -closed. In the topology  $\sigma = \{ \emptyset, X, \{a\}, \{a, b\} \}$ , the set  $\{b\}$  is  $g^*\alpha$ -closed but not  $\tau^*$ - $g\lambda$ -closed.
- (v) The concepts of strongly  $g^*\alpha$ -closed sets and  $\tau^*$ - $g\lambda$ -closed are independent as seen from the following examples. Consider the topology  $\tau = \{ \emptyset, X, \{a\} \}$ . Then the sets  $\{a\}, \{a, b\}, \{a, c\}$  are  $\tau^*$ - $g\lambda$ -closed but not strongly  $g^*\alpha$ -closed. In the topology  $\sigma = \{ \emptyset, X, \{b\}, \{a, b\} \}$ , the set  $\{a\}$  is strongly  $g^*\alpha$ -closed but not  $\tau^*$ - $g\lambda$ -closed.
- (vi) The concepts of semi-closed sets and  $\tau^*$ - $g\lambda$ -closed are independent as seen from the following examples. Consider the topology  $\tau = \{ \emptyset, X, \{a\} \}$ . Then the sets  $\{a\}, \{a, b\}, \{a, c\}$  are  $\tau^*$ - $g\lambda$ -closed but not semi-closed. In the topology  $\sigma = \{ \emptyset, X, \{a\}, \{a, b\} \}$ , the set  $\{b\}$  is semi-closed but not  $\tau^*$ - $g\lambda$ -closed.
- (vii) The concepts of pre-closed sets and  $\tau^*$ - $g\lambda$ -closed are independent as seen from the following examples. Consider the topology  $\tau = \{ \emptyset, X, \{a\} \}$ . Then the sets  $\{a\}, \{a, b\}, \{a, c\}$  are  $\tau^*$ - $g\lambda$ -closed but not pre-closed. In the topology  $\sigma = \{ \emptyset, X, \{a\}, \{a, c\} \}$ , the set  $\{b\}$  is pre-closed but not  $\tau^*$ - $g\lambda$ -closed.
- (viii) The concepts of  $\alpha$ -closed sets and  $\tau^*$ - $g\lambda$ -closed are independent as seen from the

following examples. Consider the topology  $\tau = \{ \emptyset, X, \{a\} \}$ . Then the sets  $\{a\}, \{b\}, \{c\}, \{a, b\}, \{a, c\}$  are  $\tau^*$ - $g\lambda$ -closed but not  $\alpha$ -closed. In the topology  $\sigma = \{ \emptyset, X, \{c\}, \{a, c\} \}$ , the set  $\{a\}$  is  $\alpha$ -closed but not  $\tau^*$ - $g\lambda$ -closed.

- (ix) The concepts of  $b$ -closed sets and  $\tau^*$ - $g\lambda$ -closed are independent as seen from the following examples. Consider the topology  $\tau = \{ \emptyset, X, \{b\} \}$ . Then the sets  $\{b\}, \{a, b\}, \{b, c\}$  are  $\tau^*$ - $g\lambda$ -closed but not  $b$ -closed. In the topology  $\sigma = \{ \emptyset, X, \{b\}, \{c\}, \{b, c\} \}$ , the sets  $\{b\}$  and  $\{c\}$  are  $b$ -closed but not  $\tau^*$ - $g\lambda$ -closed.
- (x) The concepts of semi pre-closed sets and  $\tau^*$ - $g\lambda$ -closed are independent as seen from the following examples. Consider the topology  $\tau = \{ \emptyset, X, \{b\} \}$ . Then the sets  $\{b\}, \{a, b\}$  and  $\{b, c\}$  are  $\tau^*$ - $g\lambda$ -closed but not semi pre-closed. In the topology  $\sigma = \{ \emptyset, X, \{b\}, \{c\}, \{b, c\} \}$ , the sets  $\{b\}$  and  $\{c\}$  are semi pre-closed but not  $\tau^*$ - $g\lambda$ -closed.

**Remark 3.16**

From the above discussions, we obtain the following implications

**4.  $\tau^*$ - $g\lambda$ -CONTINUOUS FUNCTION IN TOPOLOGICAL SPACES**

In this section, we introduce the concept of  $\tau^*$ - $g\lambda$ -continuous maps in topological spaces and study some of its properties.

**Definition 4.1**

A function  $f: X \rightarrow Y$  is called  $\tau^*$ - $g\lambda$ -continuous if  $f^{-1}(V)$  is  $\tau^*$ - $g\lambda$ -closed in  $X$  for every closed set  $V$  of  $Y$ .

### Theorem 4.2

Let  $f: (X, \tau) \rightarrow (Y, \sigma)$  be  $g$ -continuous. Then  $f$  is  $\tau^*$ - $g\lambda$ -continuous but not conversely.

**Proof:** Let  $V$  be a closed set in  $Y$ . then  $f^{-1}(V)$  is  $g$ -closed set in  $(X, \tau^*)$  since  $f$  is  $g$ -continuous. By theorem "Every  $g$ -closed set is  $\tau^*$ - $g\lambda$ -closed",  $f^{-1}(V)$  is  $\tau^*$ - $g\lambda$ -closed set in  $X$ . Then  $f$  is  $\tau^*$ - $g\lambda$ -continuous.

### Example 4.3

Let  $(X, \tau)$  and  $(Y, \sigma)$  be topological spaces where  $X=Y=\{a, b, c\}$  with topology  $\tau = \{\emptyset, X, \{a\}\}$  and  $\sigma = \{\emptyset, X, \{a\}, \{b,c\}\}$ . Let  $f: X \rightarrow Y$  be the identity function. Then  $f$  is  $\tau^*$ - $g\lambda$ -continuous. But  $f$  is not  $g$ -continuous. Since the closed set  $\{a\}$  in  $Y$ ,  $f^{-1}(\{a\})$  is not  $g$ -closed in  $X$ .

### Theorem 4.4

Let  $f: (X, \tau) \rightarrow (Y, \sigma)$  be  $\hat{g}$ -continuous. Then  $f$  is  $\tau^*$ - $g\lambda$ -continuous but not conversely.

**Proof:** Let  $V$  be a closed set in  $(Y, \sigma)$ . then  $f^{-1}(V)$  is  $g$ -closed set in  $(X, \tau)$  since  $f$  is  $\hat{g}$ -continuous. By theorem "Every  $\hat{g}$ -closed set is  $\tau^*$ - $g\lambda$ -closed",  $f^{-1}(V)$  is  $\tau^*$ - $g\lambda$ -closed set in  $(X, \tau)$ . Then  $f$  is  $\tau^*$ - $g\lambda$ -continuous.

### Example 4.5

Let  $(X, \tau)$  and  $(Y, \sigma)$  be topological spaces where  $X=Y=\{a, b, c\}$  with topology  $\tau = \{\emptyset, X, \{b\}\}$  and  $\sigma = \{\emptyset, X, \{b\}, \{a,c\}\}$ . Let  $f: X \rightarrow Y$  be the identity function. Then  $f$  is  $\tau^*$ - $g\lambda$ -continuous. But  $f$  is not  $\hat{g}$ -continuous. Since the closed set  $\{b\}$  in  $Y$ ,  $f^{-1}(\{b\})$  is not  $\hat{g}$ -closed in  $X$ .

### Theorem 4.6

Let  $f: (X, \tau) \rightarrow (Y, \sigma)$  and  $g: (Y, \sigma) \rightarrow (Z, \gamma)$  be two functions. Then  $g \circ f$  is  $\tau^*$ - $g\lambda$ -continuous if  $g$  is continuous and  $f$  is  $\tau^*$ - $g\lambda$ -continuous

**Proof:** Let  $V$  be the closed set in  $Z$ . Then  $g^{-1}(V)$  is closed in  $Y$ . Since  $g$  is continuous. since  $f$  is  $\tau^*$ - $g\lambda$ -continuous  $f^{-1}(g^{-1}(V))$  is  $\tau^*$ - $g\lambda$ -closed in  $X$ . But  $f^{-1}(g^{-1}(V)) = (g \circ f)^{-1}(V)$ . Thus  $g \circ f$  is  $\tau^*$ - $g\lambda$ -continuous.

### Theorem 4.7

Let  $f: (X, \tau) \rightarrow (Y, \sigma)$  be a map. The following statement are equivalent

- (a)  $f$  is  $\tau^*$ - $g\lambda$ -continuous
- (b) The inverse image of each open-set in  $Y$  is  $\tau^*$ - $g\lambda$ -open in  $X$ .

**Proof:** (a) $\Rightarrow$ (b). Let  $G$  be an open set in  $Y$ . Then  $G^c$  is closed in  $Y$ . Since  $f$  is  $\tau^*$ - $g\lambda$ -continuous  $f^{-1}(G^c)$  is  $\tau^*$ - $g\lambda$ -closed in  $X$ . But  $f^{-1}(G^c) = [f^{-1}(G)]^c$ . Thus  $f^{-1}(G)$  is  $\tau^*$ - $g\lambda$ -open in  $X$ .

(b) $\Rightarrow$ (a) Let  $V$  be a closed set of  $Y$ . Then  $V^c$  is open in  $Y$ . By assumption (b)  $f^{-1}(V^c)$  is  $\tau^*$ - $g\lambda$ -open in  $X$ . Thus  $f^{-1}(V)$  is  $\tau^*$ - $g\lambda$ -closed in  $X$ . Therefore  $f$  is  $\tau^*$ - $g\lambda$ -continuous.

### Remark 4.8

The concepts of  $\tau^*$ - $g\lambda$ -continuity and semi-continuity are independent, as seen from the following examples.

### Example 4.9

Let  $X = Y = \{a, b, c\}$ . Let  $f: (X, \tau) \rightarrow (Y, \sigma)$  be the identity map where  $\tau = \{\emptyset, X, \{a, b\}\}$  and  $\sigma = \{\emptyset, Y, \{a\}, \{b\}, \{a,b\}\}$ . Then  $f$  is  $\tau^*$ - $g\lambda$ -continuous but not semi-continuous. Since the inverse image of the closed set  $\{a, c\}$  and  $\{b,c\}$  in  $Y$  are not semi-closed in  $X$ .

### Example 4.10

Let  $X = Y = \{a, b, c\}$ ,  $\tau = \{\emptyset, X, \{a\}, \{b\}, \{a,b\}\}$  and  $\sigma = \{\emptyset, X, \{b,c\}\}$ . Let  $f: (X, \tau) \rightarrow (Y, \sigma)$  be the identity map. Then  $f$  is semi-continuous but not  $\tau^*$ - $g\lambda$ -continuous, since the inverse image of the closed set  $\{a\}$  in  $Y$  is not  $\tau^*$ - $g\lambda$ -continuous.

### Remark 4.11

The concepts of  $\tau^*$ - $g\lambda$ -continuity and  $g_s$ -continuity are independent, as seen from the following examples.

### Example 4.12

Let  $X = Y = \{a, b, c\}$ ,  $\tau = \{\emptyset, X, \{a, b\}\}$  and  $\sigma = \{\emptyset, Y, \{b, c\}\}$ . Let  $f: (X, \tau) \rightarrow (Y, \sigma)$  be the identity map. Then  $f$  is  $\tau^*$ - $g\lambda$ -continuous but not  $g_s$ -continuous, since the inverse image of the closed set  $\{a\}$  in  $Y$  is not  $g_s$ -closed in  $X$ .

### Example 4.13

Let  $X = Y = \{a, b, c\}$ ,  $\tau = \{\emptyset, X, \{a\}, \{b\}, \{a, b\}\}$  and  $\sigma = \{\emptyset, Y, \{b, c\}\}$ . Let  $f: (X, \tau) \rightarrow (Y, \sigma)$  be the identity map. Then  $f$  is  $g_s$ -continuous but not  $\tau^*$ - $g\lambda$ -continuous, since the inverse image of the closed set  $\{a\}$  in  $Y$  is not  $\lambda$ -closed in  $X$ .

### Remark 4.14

From the above discussions, we obtain the following implications

### Definition 4.15

A topological space  $(X, \tau)$  is called  $T_{\tau^* - g\lambda}$ -space if every  $\tau^*$ - $g\lambda$ -closed set is closed in  $X$ .

### Theorem 4.16

If  $X$  is  $T_{\tau^* - g\lambda}$ -space and  $f: (X, \tau) \rightarrow (Y, \sigma)$  is  $\tau^*$ - $g\lambda$ -continuous, then  $f$  is continuous.

**Proof:** Let  $f: (X, \tau) \rightarrow (Y, \sigma)$  be  $\tau^*$ - $g\lambda$ -continuous and let  $V$  be any closed set in  $(Y, \sigma)$ . Then  $f^{-1}(V)$  is  $\tau^*$ - $g\lambda$ -closed set in  $X$ , since  $f$  is  $\tau^*$ - $g\lambda$ -continuous. Since  $X$  is  $T_{\tau^* - g\lambda}$ -space  $f^{-1}(V)$  is closed in  $X$ . Hence  $f$  is continuous.

## 5. CONCLUSION

In this paper we have introduced  $\tau^*$ - $g\lambda$ - closed sets,  $\tau^*$ - $g\lambda$ - open sets and studied some of its basic properties. Also we have studied the relationship between  $\tau^*$ - $g\lambda$ - continuous maps and some of the mappings already exist.
