Abstract
This paper deals with the theoretical investigation on high Q (80. 50 approx) multifrequency Notch type Frequency Selective Surface(FSS). The FSS is designed by cutting spiral slit into square shaped patch keeping same periodicity throughout. Compared to conventional square patch FSS the designed FSS can provide reduction in resonant frequency resulting in size reduction up to 95. 20% with respect to 2. 63GHz resonant frequency. The multiple (fourteen) resonating frequencies have been obtained with the help of this design. Theoretical investigations have been done by Ansoft Designer® software.
