Abstract

In today's era acquiring information about others is not a difficult task but securing this data from interlopers is a big deal. K-anonymity model is used to protect released data. Released data which is available for public use may contain sensitive and non-sensitive data. But K-anonymity model faces changes when set of sensitive attributes are present in the data set. To achieve K-anonymous table with diversity may cause distortion of data in some extent. This paper proposes a new concept to minimize this data distortion without using tuple suppression for
K-anonymity Model for Multiple Sensitive Attributes

M-SA  K-anonymity Model.
