#### Abstract

We investigate in this paper the dynamics and the method of generating fractal images for Ishikawa iteration procedure. The geometry of relative superior Julia sets are explored for Ishikawa iteration.

## Keywords

Complex dynamics, relative superior Julia Set, Ishikawa Iteration.

## 1. INTRODUCTION

Many authors have presented the papers on several "orbit traps" rendering methods to create the artistic fractal images. An orbit trap is a bounded area in complex plane into which an orbiting point may fall. Motivated by this idea of "orbit traps", this paper introduces the different types of orbit traps for Ishikawa iteration procedure. It is well known that Julia sets of $z_{n+1}=a z_{n}^{2}+c$ are connected and bounded for $a$ and $c$. So, we consider them as orbit traps and explore their relative fractal images.

## 2. PRELIMINARIES

Let $\left\{z_{n}: n=1,2,3,4 \ldots \ldots \ldots\right\}$, denoted by $\left\{z_{n}\right\}$ be a sequence of complex numbers. Then, we say $\operatorname{Lim}_{n \rightarrow \infty} z_{n}=\infty$ if for given $\mathrm{M}>0$, there exists $\mathrm{N}>0$, such that for all $\mathrm{n}>\mathrm{N}$, we must have $\left|z_{n}\right|>M$. Thus all the values of $z_{n}$, lies outside a circle of radius $M$, for sufficiently large values of $n$.

$$
\text { Let } Q(z)=a_{0} z^{n}+a_{1} z^{n-1}+a_{2} z^{n-2}+\ldots . . . . . . . . . . .+a_{n-1} z^{1}+a_{n} z^{0} ; a_{0} \neq 0 \text { be }
$$

a polynomial of degree n , where $n \geq 2$. The coefficients are allowed to be complex numbers. In other words, it follows that $Q_{c}(z)=z^{2}+c$.
Definition 2.1: Let X be a nonempty set and $f: X \rightarrow X$. For any point $x_{0} \in X$, the Picard's orbit is defined as the set of iterates of a point $x_{0}$, that is; $O\left(f, x_{0}\right)=\left\{x_{n} ; x_{n}=f\left(x_{n-1}\right), n=1,2,3 \ldots ..\right\}$.

In functional dynamics, we have existence of two different types of points. Points that leave the interval after a finite number are in stable set of infinity. Points that never leave the interval after any number of iterations have bounded orbits.

So, an orbit is bounded if there exists a positive real number, such that the modulus of every point in the orbit is less than this number. The collection of points that are bounded, i.e. there exists M , such that $\left|Q^{n}(z)\right| \leq M$, for all n , is called as a prisoner set while the collection of points that are in the stable set of infinity is called the escape set. Hence, the boundary of the prisoner set is simultaneously the boundary of escape set and that is Julia set for Q .
Definition 2.2: The set of points $K$ whose orbits are bounded under the iteration function of $Q_{c}(z)$ is called the Julia set. We choose the initial point 0 , as 0 is the only critical point of $Q_{c}(z)$.

## 3. ISHIKAWA ITERATION FOR RELATIVE SUPERIOR JULIA SETS

Let $X$ be a subset of real or complex numbers and $f: X \rightarrow X$. For $x_{0} \in X$, we construct the sequences $\left\{x_{n}\right\}$ and $\left\{y_{n}\right\}$ in X in the following manner:
$y_{0}=s_{0}^{\prime} f\left(x_{0}\right)+\left(1-s_{0}^{\prime}\right) x_{0}$
$y_{1}=s_{1}^{\prime} f\left(x_{1}\right)+\left(1-s_{1}^{\prime}\right) x_{1} \ldots \ldots$.
$y_{n}=s_{n}^{\prime} f\left(x_{n}\right)+\left(1-s_{n}^{\prime}\right) x_{n}$
where $0 \leq s_{n}^{\prime} \leq 1$ and $\quad s_{n}^{\prime}$ is convergent to non zero number
and
$x_{1}=s_{0} f\left(y_{0}\right)+\left(1-s_{0}\right) x_{0}$
$x_{2}=s_{1} f\left(y_{1}\right)+\left(1-s_{1}\right) x_{1} \ldots \ldots$
$x_{n}=s_{n-1} f\left(y_{n-1}\right)+\left(1-s_{n-1}\right) x_{n-1}$
where $\quad 0 \leq s_{n} \leq 1$ and $\quad S_{n}$ is convergent to non zero number[12].
Definition 3.1: The sequences $x_{n}$ and $y_{n}$ constructed above is called Ishikawa sequences of iteration or relative superior sequences of iterates. We denote it by $R S O\left(x_{0}, s_{n}, s_{n}^{\prime}, t\right)$.
Notice that $\operatorname{RSO}\left(x_{0}, s_{n}, s_{n}^{\prime}, t\right)$ with $s_{n}^{\prime}=1$ is $\operatorname{RSO}\left(x_{0}, s_{n}, t\right)$
i.e. Mann's orbit and if we place $s_{n}=s_{n}^{\prime}=1$ then $R S O\left(x_{0}, s_{n}, s_{n}^{\prime}, t\right)$ reduces to $O\left(x_{0}, t\right)$.We remark that Ishikawa orbit $\operatorname{RSO}\left(x_{0}, s_{n}, s_{n}^{\prime}, t\right)$ with $s_{n}^{\prime}=1 / 2$ is Relative superior orbit. Now we define Julia set for function with respect to Ishikawa iterates. We call them as Relative Superior Julia sets.
Definition 3.2: The set of points SK whose orbits are bounded under Relative superior iteration of function $\mathrm{Q}(\mathrm{z})$ is called Relative Superior Julia sets. Relative Superior Julia set of Q is boundary of Julia set RSK.
We now define escape criterions for these sets.

### 3.1 Relative Superior Escape Criterions for Quadratics

The following theorem gives us an escape Criterions for function $Q_{c}=z^{2}+c$ in respect to Ishikawa iteration procedure.
Theorem 3.1: Let's assume that $|z| \geq|c|>2 / s$; $|z| \geq|c|>2 / s^{\prime}$, where $0<s<1, \quad 0<s^{\prime}<1$ and $c$ is a complex number. Define $z_{1}=(1-s) z+s Q_{c}(z)$

$$
\begin{aligned}
& \vdots \\
& z_{n}=(1-s) z_{n-1}+s Q_{c}\left(z_{n-1}\right)
\end{aligned}
$$

where $Q_{c}(z)$ can be a quadratic, cubic or biquadratic polynomial in terms of $s^{\prime}$ and $\mathrm{n}=2,3,4, \ldots$ then $\left|z_{n}\right| \rightarrow \infty$, as $n \rightarrow \infty$.
Proof: Let's take $\quad\left|Q_{c}(z)\right|=\left|\left(1-s^{\prime}\right) z+s^{\prime} Q_{c}^{\prime}(z)\right|$, where $Q_{c}^{\prime}(z)=z^{2}+c$

$$
\begin{align*}
& =\left|s^{\prime} z^{2}+\left(1-s^{\prime}\right) z+s^{\prime} c\right| \\
& \geq\left|s^{\prime} z^{2}+\left(1-s^{\prime}\right) z\right|-\left|s^{\prime} c\right| \\
& \geq|z|\left(\left|s^{\prime} z+\left(1-s^{\prime}\right)\right|\right)-s^{\prime}|z| \quad(\because|z| \geq|c|) \\
& \geq|z|\left(\left|s^{\prime} z\right|-1+s^{\prime}\right)-s^{\prime}|z| \\
& =|z|\left(\left|s^{\prime} z\right|-1\right) \tag{1}
\end{align*}
$$

Now since, $\quad z_{n}=(1-s) z_{n-1}+s Q_{c}^{\prime}(z)$
So, $\quad\left|z_{1}\right|=\left|(1-s) z+s Q_{c}(z)\right| \quad$ on substituting (1)
$=|(1-s) z+s| z\left|\left(\left|s^{\prime} z\right|-1\right)\right|$ $=|z-s z+s| z|\cdot| s^{\prime} z|-s| z| |$
$\geq(|z|+|s z|)+\left(s|z| \cdot\left|s^{\prime} z\right|-s|z|\right)$ $\geq|z|+|s z|+s|z| \cdot\left|s^{\prime} z\right|-s|z|$
$\geq|z|\left(1+s s^{\prime}|z|\right)$, since $s|z|>2$, so, $s s^{\prime}|z|>2$, there exists $\lambda>0$, such that $s s^{\prime}|z|-1>1+\lambda$
Consequently $\quad\left|z_{1}\right|>(1+\lambda)|z|$

$$
\begin{aligned}
& \vdots \\
& \left|z_{n}\right|>(1+\lambda)^{n}|z|
\end{aligned}
$$

Thus, the Ishikawa orbit of $z$, under the quadratic function tends to infinity. This completes the proof.
Corollary 3.1: Suppose that $|c|>2 / s ;|c|>2 / s^{\prime}$.Then, the relative superior orbit of Ishikawa $\operatorname{RSO}\left(Q_{c}, 0, s, s^{\prime}\right)$ escapes to infinity.
In the proof of the theorem, we used the facts that $|z| \geq|c|$ and $|z|>2 / s$ as well as $|z|>2 / s^{\prime}$. Hence, the following corollary is the refinement of the escape criterion discussed in the above theorem.
Corollary 3.2(Escape Criterion): Suppose that $|z|>\max \left\{|c|, 2 / s, 2 / s^{\prime}\right\}$, then $\left|z_{n}\right|>(1+\lambda)^{n}|z|$ and $\left|z_{n}\right| \rightarrow \infty$ as $n \rightarrow \infty$.
Corollary 3.3: Suppose that $\left|z_{k}\right|>\max \left\{|c|, 2 / s, 2 / s^{\prime}\right\}$,
for some $\quad k \geq 0$.Then, $\quad\left|z_{k+1}\right|>(1+\lambda)^{n}\left|z_{k}\right| \quad$ and $\left|z_{n}\right| \rightarrow \infty$ as $n \rightarrow \infty$.
This corollary gives us an algorithm for computing the Relative Superior Julia sets of $Q_{c}$, for any c. Given any point $|z| \leq c \mid$, we have computed the superior orbit of z . If for some n , $\left|z_{n}\right|$ lies outside the circle of radius $\max \left\{|c|, 2 / s, 2 / s^{\prime}\right\}$, we guarantee that the orbit escapes. Hence, $z$ is not in the Relative Superior Julia sets. On the other hand, if $\left|z_{n}\right|$ never exceeds this bound, then by definition of the Relative Superior Julia sets, denoted by $R S K_{c}$. We can make extensive use of this algorithm in the next section.

### 3.2 Relative Superior Escape Criterion for Cubic Polynomials:

First, we prove the following theorem for the function $Q_{a, b}(z)=z^{3}+a z+b$ with respect to the Ishikawa iteration procedure.
Theorem 3.2: $\quad$ Suppose $|z|>|b|>(|a|+2 / s)^{1 / 2}$, $|z|>|b|>\left(|a|+2 / s^{\prime}\right)^{1 / 2}$ exists, where $0<s \leq 1 ; 0<s^{\prime}<1$ and $a$ and $b$ are in complex plane .Define $z_{1}=(1-s) z+s Q_{a, b}(z)$
$\vdots$

$$
z_{n}=(1-s) z_{n-1}+s Q_{a, b}\left(z_{n-1}\right), \mathrm{n}=2,3 \ldots \ldots
$$

where $Q_{a, b}(z)$ is the function of $s^{\prime}$, then $\left|z_{n}\right| \rightarrow \infty$ as $n \rightarrow \infty$.
Proof: Let's take $\left|Q_{a, b}(z)\right|=\left|\left(1-s^{\prime}\right) z+s^{\prime} Q_{a, b}^{\prime}(z)\right|$

$$
\begin{aligned}
& =\left|\left(1-s^{\prime}\right) z+s^{\prime}\left(z^{3}+a z+b\right)\right| \\
& =\left|s^{\prime} z^{3}+s^{\prime} a z+z-s^{\prime} z+b s^{\prime}\right|
\end{aligned}
$$

$$
\begin{aligned}
& \geq\left|s^{\prime} z^{3}+s^{\prime} a z+z-s^{\prime} z\right|-\left|b s^{\prime}\right| \\
& \geq|z|\left(\left|s^{\prime} z^{2}+s^{\prime} a+1-s^{\prime}\right|\right)-s^{\prime}|z| \quad \because|z| \geq|b| \\
& \geq|z|\left(\left|s^{\prime} z^{2}+a s^{\prime}\right|-\left|1-s^{\prime}\right|\right)-s^{\prime}|z| \\
& =|z|\left\{\left|s^{\prime} z^{2}+a s^{\prime}\right|-1+s^{\prime}-s^{\prime}\right\} \\
& =|z|\left\{s^{\prime}\left|z^{2}+a\right|-1\right\} \\
& =s^{\prime}|z|\left\{\left|z^{2}+a\right|-1 / s^{\prime}\right\} \\
& \geq s^{\prime}|z|\left\{|z|^{2}-|a|-1 / s^{\prime}\right\} \\
& =s^{\prime}|z|\left\{|z|^{2}-\left(|a|+1 / s^{\prime}\right)\right\}
\end{aligned}
$$

$$
\text { Now since }\left|z_{1}\right|=\left|(1-s) z+s Q_{a, b}(z)\right|
$$

$$
=|(1-s) z+s \cdot| z\left|\cdot\left\{s^{\prime}\left(\left|z^{2}+a\right|\right)-1\right\}\right|
$$

$$
=|z-s z+s| z\left|\cdot s^{\prime}\left(\left|z^{2}+a\right|\right)-s\right| z| |
$$

$$
\geq|z|+s|z|+\left\{s|z| \cdot s^{\prime}\left(\left|z^{2}+a\right|\right)-s|z|\right\}
$$

$$
\geq|z|+s|z|+s . s^{\prime}|z|\left(\left|z^{2}+a\right|\right)-s|z|
$$

$$
\geq|z|\left\{1+s . s^{\prime}\left|z^{2}+a\right|\right\}
$$

$$
=|z| s . s^{\prime}\left(1 / s . s^{\prime}+\left|z^{2}+a\right|\right)
$$

$$
\geq|z| s . s^{\prime}\left(1 / s . s^{\prime}+\left|z^{2}\right|-|a|\right)
$$

$$
=|z| s . s^{\prime}\left\{\left|z^{2}\right|-\left(|a|-1 / s . s^{\prime}\right)\right\}
$$

Since $|z|>(|a|+2 / s)^{1 / 2}$ and $|z|>\left(|a|+2 / s^{\prime}\right)^{1 / 2}$ exists and so $\quad|z|>\left(|a|+2 / s s^{\prime}\right)^{1 / 2}$ follows .Therefore, $\left|z^{2}\right|-\left(|a|+1 / s s^{\prime}\right)^{1 / 2}>1 / s s^{\prime}$ such
that $s s^{\prime}\left\{\left|z^{2}\right|-\left(|a|+1 / s s^{\prime}\right)\right\}>1$. Hence, there exists $\gamma>1$, such that $\left|z_{1}\right|>\gamma|z|$. Repeating this argument n time, we get $\left|z_{n}\right|>\gamma^{n}|z|$. Therefore, the Relative Superior orbit of $z$, under the cubic polynomial $Q_{a, b}(z)$, tends to infinity. This completes the proof.
Corollary 3.4: $\quad$ Suppose that $|b|>(|a|+2 / s)^{1 / 2}$ and $|b|>\left(|a|+2 / s^{\prime}\right)^{1 / 2}$ exists. Then, the Relative Superior orbit $R S O\left(Q_{a, b}, 0, s, s^{\prime}\right)$ escapes to infinity.

## Corollary 3.5(Escape Criterion):

Suppose $\quad|z|>\max \left\{|b|,(|a|+2 / s)^{1 / 2},\left(|a|+2 / s^{\prime}\right)^{1 / 2}\right\}$ then $\left|z_{n}\right| \rightarrow \infty \quad$ as $n \rightarrow \infty$. Corollary 3.5 gives an escape criterion for cubic polynomials.

## Corollary 3.6:

Assume that $\left|z_{k}\right|>\max \left\{|b|,(|a|+2 / s)^{1 / 2},\left(|a|+2 / s^{\prime}\right)^{1 / 2}\right\}$ for some $k \geq 0$. Then $\left|z_{k+1}\right|>\gamma\left|z_{k}\right|$ and $\left|z_{n}\right| \rightarrow \infty$,
as $n \rightarrow \infty$.From Corollary 3.6, we find an algorithm for computing the superior Julia sets of $Q_{a, b}(z)$, for any $a$ and $b$.

### 3.3 A General Escape Criterion:

We will obtain a general escape criterion for polynomials of the form $G_{c}(z)=z^{n}+c$.

Theorem 3.3: For general function $G_{c}(z)=z^{n}+c, \mathrm{n}=1,2$, $3,4 \ldots$ where $0<s \leq 1,0<s^{\prime}<1$ and $c$ is the complex plane.
Define $z_{1}=(1-s) z+s G_{c}(z)$
$\vdots$

$$
z_{n}=(1-s) z_{n-1}+s G_{c}\left(z_{n-1}\right)
$$

Thus, the general escape criterion is $\max \left\{|c|,(2 / s)^{1 / n+1},\left(2 / s^{\prime}\right)^{1 / n+1}\right\}$.
Proof: We shall prove this theorem by induction:
For $\mathrm{n}=1$, we get $G_{c}(z)=z+c$. So, the escape criterion is $|\mathrm{c}|$, which is obvious, i.e. $|z|>\max \{|c|, 0,0\}$
For $\mathrm{n}=2$, we get $G_{c}(z)=z^{2}+c$. So, the escape criterion is $|z|>\max \left\{|c|, 2 / s, 2 / s^{\prime}\right\}$ (See Theorem 3.1)
For $\mathrm{n}=3$, we get $G_{c}(z)=z^{3}+c$. So, the result follows from Theorem 3.2 with $\mathrm{a}=0$ and $\mathrm{b}=\mathrm{c}$, such that the escape criterion is $|z|>\max \left\{|c|,(2 / s)^{1 / 2},\left(2 / s^{\prime}\right)^{1 / 2}\right\}$. Hence, the theorem is true for $\mathrm{n}=1,2,3,4 \ldots$

Now, suppose that theorem is true for any $n$. Let $G_{c}(z)=z^{n+1}+c \quad$ and $|z| \geq|c|>(2 / s)^{1 / n+1} \quad$ as well as $|z| \geq|c|>\left(2 / s^{\prime}\right)^{1 / n+1}$ exists. Then,

$$
\begin{aligned}
& \left|G_{n}(z)\right|=\left|\left(1-s^{\prime}\right) z+s^{\prime} G_{c}^{\prime}(z)\right| \text { where } G_{c}^{\prime}(z)=z^{n+1}+c \\
& \quad=\left|z-s^{\prime} z+s^{\prime}\left(z^{n+1}+c\right)\right| \\
& \quad \geq\left|s^{\prime} z^{n+1}-s^{\prime} z+z\right|-s^{\prime}|c| \\
& \geq|z|\left(s^{\prime}\left|z^{n}\right|-s^{\prime}+1\left|-s^{\prime}\right| z \mid \quad(\because|z| \geq|c|)\right. \\
& \geq|z|\left\{\left(s^{\prime}\left|z^{n}\right|+\left|s^{\prime}\right|-|1|\right\}-s^{\prime}|z|\right. \\
& \geq|z|\left(s^{\prime}\left|z^{n}\right|+s^{\prime}-1-s^{\prime}\right) \\
& \geq|z|\left(s^{\prime}\left|z^{n}\right|-1\right)
\end{aligned}
$$

Now, $\left|z_{1}\right|=\left|(1-s) z+s G_{n}(z)\right|$
$=|(1-s) z+s| z\left|\left(s^{\prime}\left|z^{n}\right|-1\right)\right|$
$=|z-s z+s| z\left|\cdot s^{\prime}\right| z^{n}|-s| z| |$
$\geq(|z|-s|z|)+\left(s s^{\prime}\left|z^{n+1}\right|-s|z|\right)$
$\geq\left(s s^{\prime}\left|z^{n+1}\right|+|z|\right)$
$\geq\left|s s^{\prime} z^{n+1}\right|-|z|$
$\geq|z|\left(s s^{\prime}\left|z^{n}\right|-1\right)$

Since $|z|>(2 / s)^{1 / n} ;|z|>\left(2 / s^{\prime}\right)^{1 / n}$ and $|z|>\left(2 / s s^{\prime}\right)^{1 / n}$ .So $|z|>\left(2 / s s^{\prime}\right)^{1 / n}$, therefore $\left(s s^{\prime}\left|z^{n}\right|-1\right)>1$
Hence, for some $\lambda>0$, we have $\left(s s^{\prime}\left|z^{n}\right|-1\right)>1+\lambda$.
Thus, $\quad\left|z_{1}\right|>(1+\lambda)|z|$
!

$$
\left|z_{n}\right|=(1+\lambda)^{n}|z|
$$

Therefore, the Ishikawa orbit of $z$ under the iteration of $z^{n+1}+c$ tends to infinity. Hence $|z|>\max \left\{|c|,(2 / s)^{1 / n},\left(2 / s^{\prime}\right)^{1 / n}\right\}$ is the escape criterion. This proves the theorem.
Corollary 3.7: $\quad$ Suppose that $|c|>(2 / s)^{1 / n-1}$ and $|c|>\left(2 / s^{\prime}\right)^{1 / n-1}$ exists. Then, the Relative Superior orbit $R S O\left(G_{c}, 0, s, s^{\prime}\right)$ escapes to infinity.

## Corollary3.8:

Assume that $\left|z_{k}\right|>\max \left\{|c|,(2 / s)^{1 / k-1},\left(2 / s^{\prime}\right)^{1 / k-1}\right\}$ for some $k \geq 0$. Then $\left|z_{k+1}\right|>\gamma\left|z_{k}\right|$ and $\left|z_{n}\right| \rightarrow \infty$, as $n \rightarrow \infty$. This corollary gives an algorithm for computing the Relative Superior Julia sets for the functions of the form $G_{c}(z)=z^{n}+c, \mathrm{n}$ $=1,2,3,4 \ldots$

## 4. FIXED POINTS

### 4.1 Fixed points of quadratic polynomial

We skipped 29 iterations and after 55 iterations value converges

Figure 3. Orbit of $\mathrm{F}(\mathrm{z})$ for $\left(\mathbf{z}_{0}=\mathbf{- 0 . 1 1 8}+\mathbf{0 . 0 2 1 i}\right)$ at $\mathbf{s}=\mathbf{0} .4$ and $\mathrm{s}^{\prime}=\mathbf{0 . 1}$

## 5. GENERATION OF RELATIVE SUPERIOR JULIA

 SETS:We generated the Relative Superior Julia sets. We present here some beautiful filled Relative Superior Julia sets for quadratic, cubic and biquadratic function.
5.1 Relative Superior Julia sets for Quadratic:

Figure 1: Relative Superior Julia Set for $\mathrm{s}=\mathrm{s}^{\prime}=\mathbf{1}, \mathrm{c}=\mathbf{- 1 . 3 8}$

Figure 2: Relative Superior Julia Set for $s=1, s^{\prime}=\mathbf{0} .3$,

Figure 3: Relative Superior Julia Set for $\mathrm{s}=\mathbf{0 . 3}, \mathrm{s}^{\prime}=\mathbf{1}$,

Figure 4: Relative Superior Julia Set for $\mathrm{s}=\mathbf{0} .1, \mathrm{~s}^{\prime}=\mathbf{0} .4$,

Figure 5: Relative Superior Julia Set for $s=0.4, s^{\prime}=0.1$,

### 5.2 Relative Superior Julia sets for Cubic function:

Figure 1: Relative Superior Julia for $\mathrm{s}=\mathrm{s}^{\prime}=\mathbf{1}, \mathrm{c}=-\mathbf{0} \mathbf{2 + 1 . 1} \boldsymbol{i}$

Figure 2: Relative Superior Julia Set for $s=1, s^{\prime}=\mathbf{0 . 5}$, $\mathrm{c}=\mathbf{- 0 . 1 4 6}+\mathbf{1 . 5 4 i}$

Figure 3: Relative Superior Julia Set for $\mathrm{s}=\mathbf{0 . 3}, \mathrm{s}^{\prime}=1, \mathrm{c}=-$ $0.5+1.41 i$

Figure 4: Relative Superior Julia Set for $\mathrm{s}=\mathbf{0} .1, \mathrm{~s}^{\prime}=\mathbf{0 . 4}$, $c=-1.6+6.7 \mathrm{i}$

Figure 5: Relative Superior Julia Set for $\mathrm{s}=\mathbf{0 . 4}, \mathrm{s}^{\prime}=\mathbf{0} .1$,

5.3 Relative Superior Julia sets for Bi-quadratic function:

Figure 1: Relative Superior Julia for $\mathrm{s}=\mathrm{s}^{\prime}=1, \mathrm{c}=\mathbf{0 . 5 8} \mathbf{- 0 . 9 8 i}$

Figure 2: Relative Superior Julia Set for $\mathrm{s}=1, \mathrm{~s}^{\prime}=\mathbf{0 . 5}, \mathrm{c}=\mathbf{- 1 . 5 7}$

Figure 3: Relative Superior Julia Set for $\mathbf{s = 0 . 5}, \mathrm{s}^{\prime}=\mathbf{1}, \mathrm{c}=\mathbf{- 1 . 2 4}$

Figure 4: Relative Superior Julia Set for $\mathrm{s}=\mathbf{0 . 1}, \mathrm{s}^{\prime}=\mathbf{0 . 4}$,

Figure 5: Relative Superior Julia Set for $\mathrm{s}=0.3, \mathrm{~s}^{\prime}=\mathbf{0 . 4}, \mathrm{c}=-$ 3.6+0.0i
